VARIOUS LOCATIONS
RULE 1166 CONTAMINATED SOIL MITIGATION PLAN

Reference is made to your application (A/N 406479)-for the excavation and handling of VOC-contaminated soil at various locations within the South Coast Air Quality Management District.

In accordance with Rule 1166 (c), this approved plan is required prior to commencing excavation of any underground storage tank or transfer piping which has previously been used to store or transfer volatile organic compounds (VOC) or during the excavation, handling, or storage of VOC-contaminated soils.

The rights and privileges granted through the issuance of this plan are restricted exclusively to the plan holder to whom it was issued, and are non-transferable, even with the written or expressed consent of the plan holder listed above.

A VARIOUS LOCATIONS PLAN can be used at a site to excavate and remove a maximum of 2000 cubic yards of VOC contaminated soil at the site. Any treatment or additional excavation of VOC contaminated soil at the site will require the issuance of a SITE SPECIFIC plan by the AQMD. Multiple use of VARIOUS LOCATIONS PLANS to excavate over 2000 cubic yards of contaminated soil for the same site is prohibited per Rule 1166.

This excavation and mitigation plan has been approved under the provisions of Rule 1166 of the Rules and Regulations of the AQMD and is subject to the following conditions.

THIS PLAN WILL EXPIRE ONE YEAR FROM THE ISSUE DATE.

IF YOU WISH TO MAINTAIN A CURRENT PLAN AFTER THAT DATE, FILE AN APPLICATION FOR A NEW PLAN AT LEAST TWO MONTHS PRIOR TO THE EXPIRATION DATE OF THE CURRENT PLAN.

PLAN CONDITIONS

SECTION I – GENERAL REQUIREMENTS

1. A SIGNED COPY OF THIS PLAN SHALL BE PRESENT AT EACH EXCAVATION SITE AT ALL TIMES AND SHALL BE MADE AVAILABLE TO AQMD PERSONNEL UPON REQUEST.

In the event of any physical or atmospheric adversely affecting the STANDARD SAFETY DESIGNATIONS assigned to any of the above spaces, or if any doubt, immediately stop all work and contact the undersigned Marine Chemist

QUALIFICATIONS: Transfer of ballast or manipulation of valves or closure equipment tending to alter conditions in pipe lines, tanks or compartments subject to gas accumulation, unless specifically approved in this Certificate, requires inspection and endorsement or reissue of Certificate for the spaces so affected. All lines, vents, heating coils, valves, and similarly enclosed appurtenances shall be considered "not safe" unless otherwise specifically designated.

STANDARD SAFETY DESIGNATIONS (partial list, paraphrased from NFPA 306 Subsections 2-3.1 through 2-3.5, and Subsection 5-3.2)

SAFE FOR WORKERS: Means that in the compartment or space so designated: (a) the oxygen content of the atmosphere is at least 19.5 percent by volume; and that, (b) toxic materials in the atmosphere are within permissible concentrations; and that, (c) the residues are not capable of producing toxic materials under existing atmospheric conditions while maintained as directed on the Marine Chemist's Certificate.

NOT SAFE FOR WORKERS: Means that in the compartment or space so designated, the requirements of Safe for Workers have not been met.

ENTER WITH RESTRICTIONS: Means that in any compartment or space so designated, entry for work may be made only if conditions of proper protective equipment, clothing, and time are specified.

SAFE FOR HOT WORK: Means that in any compartment designated: (a) oxygen content of the atmosphere is at least 19.5 percent by volume, with the exception of inerted spaces or where external hot work is to be performed; and that, (b) the concentration of flammable materials in the atmosphere is below 10 percent of the lower flammable limit; and that, (c) the residues are not capable of producing a higher concentration than permitted by (b) above under existing atmospheric conditions in the presence of fire, and while maintained as directed on the Marine Chemist's Certificate; and further, that, (d) all adjacent spaces containing or having contained flammable or combustible materials have been cleaned sufficiently to prevent the spread of fire, or are satisfactorily inerted, or, in the case of fuel tanks or lube oil tanks, or engine room or fire room bilges, have been treated in accordance with the Marine Chemist's requirements.

NOT SAFE FOR HOT WORK: Means that in the compartment so designated, the requirements of Safe for Hot Work have not been met.

CHEMIST'S ENDORSEMENT: This is to certify that I have personally determined that all spaces in the foregoing list are in accordance with NFPA 306 Control of Gas Hazards on Vessels and have found the condition of each to be in accordance with its assigned designation.

"The undersigned acknowledges receipt of this Certificate under Section 2-6 of NFPA 306 and understands conditions and limitations under which it was issued"

[signature] NIELD — 7-07-03

This Certificate is based on conditions existing at time the inspection herein set forth was completed and is issued subject to compliance with qualifications and instructions.

LABORATORY REPORTS AND CHAIN OF CUSTODY DOCUMENTS FOR SOIL SAMPLES

Southland Technical Services, Inc.
Environmental Laboratories

07-28-2003

Mr. Scott Rowlands
URS Corporation
2020 E. First Street, Suite 400
Santa Ana, CA 92705

Project: 29868258
Project Site: Irwindale
SSample Date: 07-23-2003
Lab Job No.: UR307147

Dear Mr. Rowlands:

Enclosed please find the analytical report for the sample(s) received by STS Environmental Laboratories on 07-24-2003 and analyzed by the following EPA methods:

EPA 8015M (Diesel)
EPA 8015M (Gasoline)
EPA 8260B (BTEX & Oxygenates by GC/MS)

All analyses have met the QA/QC criteria of this laboratory.

The sample(s) arrived in good conditions (i.e., chilled, intact) and with a chain of custody record attached.

STS Environmental Laboratory is certified by CA DHS (Certificate Number 1986). Thank you for giving us the opportunity to serve you. Please feel free to call me at (323) 888-0728 if our laboratory can be of further service to you.

Sincerely,

Roger Wang, Ph. D.
Laboratory Director

Lab Job No.: UR308148

Dear Mr. Liles:

Enclosed please find the analytical report for the sample(s) received by STS Environmental Laboratories on 08-27-2003 and analyzed by the following EPA methods:

EPA 8021B (BTEX,MTBE)
EPA 8015M (Gasoline)
EPA 8015M (Diesel)
EPA 8260B (GC/MS Confirmation of MTBE)

All analyses have met the QA/QC criteria of this laboratory.

The sample(s) arrived in good conditions (i.e., chilled, intact) and with a chain of custody record attached.

STS Environmental Laboratory is certified by CA DHS (Certificate Number 1986). Thank you for giving us the opportunity to serve you. Please feel free to call me at (323) 888-0728 if our laboratory can be of further service to you.

Sincerely,

Roger Wang, Ph. D.
Laboratory Director

Enclosures

This cover letter is an integral part of this analytical report.

Duplicate or Spike Duplicate	✓(1)	✓(3)	✓(4)
Field Duplicate	✓	✓	✓
Trip Blank	NA	NA	NA

✓ = Quality control evaluation criteria met. NA = Not Applicable or Not Analyzed

Notes:

1. MS/MSD was conducted on sample FD3-4-030723. The results were within acceptance criterion.
2. Surrogate recovery was outside of acceptance limits for TPH-diesel analysis for three samples (FD1-4-030723, FD2-4-030723, SFD2-4-030723). Consequently for these samples the TPH-diesel results were qualified as estimated (J) to reflect the potential of high bias.
3. MS/MSD was conducted on sample T1A-17-030723. The results were within acceptance criterion.
4. MS/MSD was conducted on sample T1B-17-030723. The results were within acceptance criterion.

Summary: Based on this Level III validation covering the QC parameters listed in the table above, these data are considered to be useable for meeting project objectives. However, the data user must evaluate the ultimate usability of the data based on the reporting limits obtained. The table below lists the detection limits obtained for undiluted samples.

Analyte	Detection Limits Obtained
TPH-Diesel	10
TPH-Gasoline	1
Benzene, Toluene, Ethyl Benzene	0.002
Total Xylenes	0.004
MTBE	0.005
TBA	0.02
Other Oxygenates	0.005

Soil units are milligrams per kilogram (mg /kg).

Four samples (T1A-17-030723, FD1-4-030723, FD2-4-030723, SFD2-4-030723) required dilution for the EPA 8260B analysis. For these samples, there are also non-detect BTEX and fuel oxygenates results with elevated reporting limits. The data user must evaluate the utility of non-detect BTEX, and fuel oxygenates results with elevated reporting limits.

SUBJECT: COMPACTION TESTING

REPORT OF TESTS

In compliance with your request, Smith-Emery Laboratories has conducted standard compaction testing for the above referenced project.

Field density tests to determine relative compaction were conducted in accordance with ASTM D2922-91, nuclear method.

Test locations and results are presented on the attached Table 1. Laboratory compaction characteristics of soil tests were performed on representative samples in accordance with, ASTM D2922-91, five layer method. Test results are presented on the attached Table 2.

Respectfully submitted,

SMITH-EMERY LABORATORIES

Danny Randall
Operations Manager

NOTE: This report contains a weekly summary of compaction test results only and it should not be submitted to City or County grading departments as a certified compaction earth fill report.

A LADPW June 10, 2004 Correspondence

1.0 INTRODUCTION/SITE BACKGROUND

This Work Plan, prepared by URS Corporation (URS) on behalf of The Realty Associates Fund V, L.P., details the rationale and procedures for conducting additional assessment in the area of removed underground storage tanks (USTs) at the former Hughes Family Market distribution center and warehouse located at 5305 Rivergrade Road in the City of Irwindale, California (Figure 1). The additional assessment was requested by the County of Los Angeles Department of Public Works, Environmental Programs Division (LADPW) in correspondence dated June 10, 2004 (Appendix A).

On July 23, 2003, URS Corporation (URS) removed three 12,000-gallon USTs at the above-referenced property (Site). Two of the three USTs removed were used to store diesel fuel and one was used to store unleaded gasoline (Figure 2). The USTs were double-walled Plasteel with appropriate alarms, spill containment, and overflow protection devices installed to ensure against spills and leaks from the operating systems. These USTs were reportedly installed in 1992 and were last used in 1997-1998. URS personnel conducted the UST removals in accordance with the guidelines and under regulatory oversight of the LADPW.

Per the requirements of the UST closure permit, soil samples were obtained from beneath the removed USTs, product piping, and fuel dispensers using an excavator and/or backhoe. The soil samples were analyzed in a fixed laboratory for total petroleum hydrocarbons as gasoline (TPHg) and diesel fuel (TPHd), by EPA Method 8015M, and for volatile fuel constituents benzene, toluene, ethylbenzene, total xylenes (BTEX) and fuel oxygenates Methyl tert-Butyl Ether (MTBE), Di-isopropyl Ether (DIPE), Ethyl tert-butyl Ether (ETBE), tert-Amyl Methyl Ether (TAME) and tert-Butanol (TBA) by EPA Method 8260B. A summary of the analytical results is provided on Table 1 and the soil sample locations are shown on Figure 2.

Following a review of the laboratory data, additional soil was excavated in the areas of fuel dispenser 1, fuel dispenser 2, satellite fuel dispenser 2, satellite fuel dispenser 3, and below the northern end of UST T2 where soil samples contained concentrations of TPHg or TPHd above 100 mg/kg. The excavation for impacted soil was conducted on August 27, 2003. The objective of this operation was to remove accessible soil affected with petroleum hydrocarbons prior to backfilling and repaving the former UST and fuel dispensing area. Soil was removed to a depth of several feet below the previous soil sampling locations. Specifically the soil beneath fuel dispensers 1 and 2 was removed to a depth of approximately 9½ feet below ground surface (bgs). Soil beneath satellite fuel dispenser 2 was removed to depth of approximately 9½ feet bgs. Soil beneath satellite fuel dispenser 3 was removed to a depth of approximately 8 feet bgs. Soil beneath removed UST T2 was removed to a depth of approximately 21 feet bgs. Following this round of excavation soil samples were taken from the bottom and sides of the excavation to verify soil conditions.

A review of laboratory analytical results for soil samples collected August 27, 2003 indicated further excavation was required in selected areas. This led to additional several feet of soil being removed from the areas of fuel dispenser 1 and fuel dispenser 2 on September 28, 2003. Additional soil was removed from the bottom of the excavation to a depth of approximately 11 feet bgs. Following this round of

excavation soil samples were taken from the excavation areas to confirm that impacted soil was removed from the area. Five samples were collected in the vicinity of the former UST tank number 2. Sixteen samples were collected from beneath the former fuel dispensers at various depths. A summary of the analytical results for the soil samples collected during August 27 and September 28, 2003 is provided in Table 2. The confirmation sample locations are shown on Figure 3.

Approximately 47 tons of petroleum hydrocarbon affected soil excavated from the areas of the UST T2 and fuel dispensers 1 and 2 and satellite fuel dispensers 2 and 3 was transported to Thermal Remediation Solutions in Azusa, California for disposal/recycling.

Confirmatory sampling provided the following results: BTEX and MTBE were not detected at or above laboratory reporting limits in any of the soil samples collected, excluding one sample from beneath UST T2 which contained 0.021 mg/kg of MTBE. However, this sample was re-analyzed for MTBE by EPA method 8260B and the MTBE detection was not confirmed and therefore is not considered valid. TPHg was detected in one soil sample collected beneath fuel dispensers 1 and 2 at concentration of 2.3 mg/kg. TPHd was detected in soil samples at concentrations ranging from 11 mg/kg to 481 mg/kg. It should be noted that additional soil was excavated in the area of the 481 mg/kg detection, and a second confirmation sample collected from this location yielded a non-detect concentration of TPHd.

In summary, confirmation samples collected from the excavations indicate the residual concentrations of TPHd remaining in soil do not exceed 15 mg/kg. Residual concentrations of toluene remaining in soil do not exceed 0.003 mg/kg. Residual concentrations of MTBE remaining in soil do not exceed 0.071 mg/kg (sample T1A-17-030723 collected from below the northern end of UST T1 at a depth of 17 feet bgs). During the field work it was decided that the residual concentrations could not be easily removed because the excavation was caving in and undermining the concrete slab adjacent to the excavation.

URS prepared a UST Removal Project Report dated November 3, 2003 for submittal to the LADPW which described the UST removal and soil excavation project in further detail. Following review of the UST Removal Project Report the LADPW issued a letter dated June 10, 2004 with additional closure requirements for the Site (Appendix A). The additional closure requirements for the site include "submit(ting) a work plan to define the lateral and vertical extent of contamination" and completing borings to minimum depth of 25 feet below the deepest detectable compound (or first groundwater)".

We have reviewed the data and believe the lateral extent of soil impacted with petroleum hydrocarbons and fuel oxygenates in the areas of the removed USTs and dispensers was effectively defined during the UST removal and soil excavation project conducted in 2003 and is detailed in the UST Removal Project Report (URS, Nov. 2003). It is the opinion of The Realty Associates Fund V, L.P. and URS that no further assessment of the lateral impact of petroleum hydrocarbons and fuel oxygenates in the areas of the removed USTs and dispensers should be required. Haley & Aldrich, Inc. contacted LADPW on behalf of The Realty Associates Fund V, L.P. to discuss the focus of the additional assessment. It is URS' understanding based on information provided from Haley & Aldrich, Inc. that the LADPW is concerned about the potential threat to groundwater resources from residual MTBE concentrations remaining in shallow subsurface soils at the Site.

The purpose of the additional assessment proposed in this Work Plan is to further define the vertical extent of MTBE impacted soil in the areas of removed UST T1 and UST T2. These locations were targeted because: 1) the area beneath removed UST T1 has the highest residual concentration of MTBE at 0.071 mg/kg at a depth of 17 feet bgs. and 2) UST T2 previously had elevated concentrations of TPHd and MTBE. although impacted soil was excavated from this area and confirmation samples collected contained non-detectable (ND) concentrations of TPHg. TPHd. BTEX and fuel oxygenates. Due to the existing canopy. these proposed boring locations are also the closest that a conventional drilling rig can get to removed fuel dispensers FD5 and FD6 where low detections of MTBE in residual shallow soil remain (0.05 and 0.014 mg/kg). This Work Plan is being submitted in response to the LADPW's additional closure requirements for the Site. The data collected from the additional assessment will be used to evaluate the Site for regulatory closure.

2.0 GEOLOGY AND HYDROGEOLOGY

The Site is located the northern half of the San Gabriel Valley approximately 3½ miles from the southern flank for the San Gabriel Mountains. The Site is bounded by the San Gabriel Riverbed to the northwest, by Rivergrade Road to the south and southeast, by Arrow Highway to the northeast, by the 605 Freeway to the west. The Santa Fe Flood Control Basin is located directly north of the Site.

Recent alluvium composed of unconsolidated deposits of gravel and sand occurs at ground surface in the area of the Site. Soil encountered in the UST excavations consisted of sands with gravel that caved easily during excavation. Boring log data for the vicinity indicates that primarily gravel or gravel and sand are present to the total depths of 300 to 500 feet bgs in the site vicinity. Boulders and cobbles are also present in shallow subsurface soils. Alluvial deposits consisting primarily of gravel, sand, silt, and clay are estimated to extend to depths of 1,000 to 2,000 feet bgs in the Site vicinity. Idealized cross-sections indicate the middle and upper Miocene age Puente and Topanga Formations underlie the alluvial deposits to undetermined depths. The Topanga and Puente Formations are marine deposits consisting of interbedded siltstones, sandstones, conglomerates, and shale (State of California DWR, 1966).

Hydrogeologically, the Site is located in the central area of the San Gabriel Valley groundwater basin. The basin is bounded on the north by the San Gabriel Mountains, on the east by uplifted subsurface bedrock between San Dimas and La Verne, on the southeast, south and west by the San Jose, Puente, Merced, and Repetto Hills, and on the northwest by the Raymond fault. The primary water bearing formations within the basin consist of unconsolidated and semi-consolidated Holocene and Pleistocene age sediments (State of California DWR, 1966).

Los Angeles County Well #4239H is located approximately 1700 feet southeast of the Site (Figure 1). Depth to groundwater in the well was last measured May 1, 2003 at 214.2 feet bgs (LADPW, September 2003). Based on this data, the depth to groundwater beneath the Site is estimated to be approximately 200 feet bgs. Based on the regional topography the direction of groundwater flow in the Site vicinity is estimated to be south-southwest.

3.0 SCOPE OF WORK

The project will be managed and field activities supervised by URS personnel under the direction of a California Registered Geologist. Methods to be utilized during the Limited Phase II Assessment are provided in the following sections.

3.1 HEALTH AND SAFETY PLAN

Prior to initiating the field activities, a site-specific health and safety plan will be prepared that:

- Identifies and describes potentially hazardous substances that could be encountered during field operations.
- Specifies protective equipment and clothing for onsite activities.
- Outlines measures to be implemented in the event of an emergency.

Field personnel will be required to review the health and safety plan prior to commencing with field activities. In addition, health and safety briefings will be conducted during the course of field activities. A copy of the health and safety plan will be kept onsite during field activities and will be archived in the project files upon completion of the field work.

3.2 UTILITY CLEARANCE

In accordance with California Assembly Bill AB 73, Underground Services Alert (USA) will be notified of our intent to conduct subsurface excavation at least 48 hours prior to initiation of intrusive field tasks. The proposed location of subsurface excavation will be clearly marked with white paint as required by California Code 4216. USA will contact utility owners of record within the vicinity and notify them of our intent to conduct subsurface excavation in proximity to buried utilities. The utility owners of record, or their designated agents, will clearly mark the position of their utilities on the ground surface throughout the area designated for drilling activities.

3.3 SOIL BORINGS AND SAMPLE COLLECTION

Two soil borings will be drilled to a target depth of 50 to 60 feet below ground surface (bgs) in the vicinity of the removed USTs to assess the vertical extent of petroleum hydrocarbon impacts (particularly MTBE) at the Site. One boring will be located at the northern end of UST T1 and one boring will be located at the northern end of UST T2. The proposed boring locations are shown on Figure 4.

Sonic drilling is the proposed method for reaching the target depths of 50 to 60 feet bgs. Drilling contractors were contacted by URS to discuss appropriate drilling methods for the Site. Due to Site's proximity to the San Gabriel Mountains subsurface soils in the site vicinity contain a large percentage of cobbles and boulders. Hollow stem auger (HSA) drill rigs commonly used for subsurface drilling and sampling in the Los Angeles Basin have encountered drill refusal at depths less than 10 feet bgs in the Site vicinity. Sonic drilling consists of advancing drill pipe utilizing high speed vibration and low speed

rotation combined with down-pressure. This drilling method is often successful in drilling through course unconsolidated geologic formations comprised of cobbles and boulders.

Core samples will be collected from the boring adjacent to the canopy and east of former fuel dispensers 1 and 2 at five foot intervals beginning at five feet bgs. Core samples will be collected from the boring at the northern end of removed UST T2 at five foot intervals beginning at a depth of 25 feet bgs (soil analytical data for the upper 21 feet in this area was collected during the soil excavation activities). The soil cores will be logged using the Unified Soil Classification System (USCS) and screened in the field for VOCs using a Photo Ionization Detector (PID). Soil boring logs including PID screening results will be provided in the project report.

Soil samples to be analyzed for volatile organic compounds (VOCs) will be collected from the sample cores using Encore™ samplers in accordance with EPA method 5035 protocol required by the Regional Water Quality Control Board, Los Angeles Region (RWQCB). Soil samples will be properly sealed, labeled, and recorded on a chain of custody document. The sample labels affixed to the samples will include the following information; sample designation, sample number, sample depth, date, collector initials, site/client name, and time of collection. The sealed and labeled samples will placed in an ice chest maintained at a temperature of three to seven degrees centigrade and transported, under chain of custody, to a California Department of Health Services accredited laboratory for analysis. Completed chain of custody documents will be provided in the project report.

Sampling equipment will cleaned after each sampling interval by washing with a dilute Alconox solution followed by rinsing with fresh water, final rinsing with distilled water, and air-drying.

3.4 Laboratory Analytical Program

The soil samples will be analyzed for TPHg and TPHd by EPA Method 8015M. The soil samples will also be analyzed for BTEX and the fuel oxygenate MTBE by EPA Method 8260B.

3.5 Waste Management

Investigation derived waste generated during the drilling program will be placed in 55-gallon UN-approved drums. The drums will be properly labeled with the date, contents, and generator information and temporarily stored onsite. The drums will be profiled for disposal at an appropriate facility following receipt of laboratory analytical results. Waste disposal documentation will be provided in the project report.

3.6 Backfill And Resurfacing

The soil borings will be backfilled with hydrated bentonite chips resurfaced with concrete.

4.0 REPORT PREPARATION

Data collected during the limited phase II assessment will be used to prepare a project report signed by a registered geologist that will include the following:

- Descriptions of field investigation methods.
- Boring logs
- Laboratory Analytical Reports and Chain of Custody documents.
- Tables summarizing analytical results.
- Site maps showing boring locations.
- Waste disposal documentation.
- Findings and conclusions regarding the vertical impacts of petroleum hydrocarbons at the site.
- A Site closure analysis based on LADPW and RWQCB guidelines.

HAZARDOUS MATERIAL UNDERGROUND STORAGE
CLOSURE REPORT
CLOSURE PERMIT NUMBER 373090
FACILITY LOCATION: 5305 NORTH RIVERGRADE ROAD, IRWINDALE

This office has reviewed the closure report dated November 3, 2003, for the subject facility.

In order to better evaluate the report, the information indicated on the enclosed Additional Closure Requirements sheet must be submitted to this office by August 18, 2004.

If you have any questions regarding this matter, please contact Mr. Andrew Ngumba, of this office, at (626) 458-3513, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

JAMES A. NOYES

ADDITIONAL CLOSURE REQUIREMENTS

The additional information or requirements checked below must be submitted to the County of Los Angeles Department of Public Works, Environmental Programs Division, P.O. Box 1460, Alhambra, CA 91802-1460, in order to complete evaluation of Closure Permit No. 373090.

[ ] Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets, and north arrow.

[ ] Insufficient number of samples was obtained. Additional samples required in accordance with attached Closure Permit Requirements.

[ ] Describe method of obtaining, handling, and/or transporting samples.

[ ] Indicate time and date samples were obtained.

[X] Submit logs certified by a CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils for all borings.

[ ] Submit chain-of-custody documentation initiated by person obtaining sample through person at Department of Health Services certified laboratory.

[ ] Disposal destination of tanks and evidence of legal disposal.

[ ] Analysis results by a State certified laboratory shall be submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

[ ] Documentation as to depth of groundwater at facility.

[ ] Manifests to document hazardous waste disposal of removed soil/tank rinsate with the signature of the disposal facility owner/operator.

[ ] Evidence of legal disposal of soils designated as non-hazardous.

[X] Signature on the report is required of CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils. The report must clearly indicate that all soil sampling was done under the supervision of the registered professional.

[X] Submit a work plan to define the lateral and vertical extent of contamination.

[X] Complete borings to groundwater or complete borings which penetrate to a minimum depth of 25 feet below the deepest detectable contamination. Borings shall be sampled and analyzed at five-foot intervals. EPA 5035 soil sampling guidelines must be utilized. All samples shall be analyzed for BTEX, MTBE, and oxygenate compounds using EPA 8260B, and for gasoline and diesel using EPA 8015(M). A voluntary cleanup oversight fee of $443 must be submitted for the review of future submittals regarding this site.

HAZARDOUS MATERIALS UNDERGROUND STORAGE TANKS
LANDOWNER NOTIFICATION AND PARTICIPATION REQUIREMENTS
FACILITY LOCATION: 5305 NORTH RIVERGRADE ROAD, IRWINDALE

This letter is to inform you of legislative requirements pertaining to cleanup and closure of sites where an unauthorized release of hazardous substance, including petroleum, has occurred from an underground storage tank (UST). Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code requires the primary or active responsible party to notify all current record owners of fee title to the site of: 1) a site cleanup proposal, 2) a site closure proposal, 3) a local agency intention to make a determination that no further action is required, and 4) a local agency intention to issue a closure letter. Section 25297.15(b) requires the local agency to take all reasonable steps to accommodate responsible landowners' participation in the cleanup or site closure process and to consider their input and recommendations.

For purposes of implementing these sections, you have been identified as the primary or active responsible party. Please provide to this agency, within 20 calendar days of receipt of this notice, the assessor parcel number(s) for the site and a complete mailing list of all current record owners of fee title to the site. You may use the enclosed list of landowners form (sample letter 2) to comply with this requirement. If the list of current record owners of fee title to the site changes, you must notify the local agency of the change within 20 calendar days from when you are notified of the change.

If you are the sole landowner, please indicate that on the landowner list form. The following notice requirements do not apply to responsible parties who are the sole landowner for the site.

In accordance with Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code, you must certify to the local agency that all current record owners of fee title to the site have been informed of the proposed action before the local agency may do any of the following:

1) Consider a cleanup proposal (corrective action plan)
2) Consider a site closure proposal
3) Make a determination that no further action is required
4) Issue a closure letter

You may use the enclosed notice of proposed action form (sample letter 3) to comply with this requirement. Before approving a cleanup proposal or site closure proposal, determining that no further action is required, or issuing a closure letter, the local agency will take all reasonable steps necessary to accommodate responsible landowner participation in the cleanup and site closure process and will consider all input and recommendations from any responsible landowner.

June 30 TH

Please submit the certification within 20 days from the date of this letter.

Initial voluntary cleanup oversight fee of $443 must be paid prior to any report review. An additional fee of $147 per hour will be charged for each hour of assessment review which exceeds the initial three-hour review estimation.

Should you have any questions regarding this matter, please contact Mr. Andrew Ngumba, of this office, at (626) 458-3513, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

A LADPW June 10, 2004 Correspondence

URS

March 21, 2005

Mr. Eric Rodriguez
County of Los Angeles
Department of Public Works
Environmental Programs Division
P.O. Box 1460
Alhambra, CA 91802-1460

RE: **Former Hughes Family Market**
5305 Rivergrade Road
Irwindale, CA 91706
DPW Permit Application No. 373090
CUPA No. W819505
For The Realty Associates Fund V, L.P.

Dear Mr. Rodriguez:

The following are responses to comments and requirements listed in the June 10, 2004 County of Los Angeles Department of Public Works, Environmental Programs Division (LADPW) correspondence following their review of the report submittal listed below for the above referenced site:

- URS' *Project Report UST Removal* dated November 3, 2003.

The LADPW comments regarding additional closure requirements are italicized and URS' responses are provided in regular text below each comment.

1. *Submit logs certified by a CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils for all borings.*

   No soil borings were drilled during the UST removal project. Therefore, no soil boring logs were submitted with the project report.

2. *Signature on the report is required of CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils. The report must clearly indicate that all soil sampling was done under the supervision of the registered professional.*

   The report is signed by J.S. Rowlands, registered CA geologist #7013 and registered certified hydrogeologist #715. Section 3.0 Scope of Work (page 3-1) of the report states that "The project was managed and field activities were supervised by URS personnel under the direction of a California Registered Geologist." The field activities would include soil sample collection, which was conducted by URS.

URS Corporation
2020 East First Street, Suite 400
Santa Ana, CA 92705
Tel: 714.835.6886
Fax: 714.667.7147

3. *Submit a work plan to define the lateral and vertical extent of contamination.*

   A work plan to define the vertical extent of petroleum hydrocarbon impact in the areas of the removed USTs and dispensers has been submitted to the LADPW with this letter. The lateral extent of impact was previously defined and is documented in URS' *Project Report UST Removal* dated November 3, 2003.

4. *Complete borings to groundwater or complete borings which penetrate to a minimum depth of 25 feet below the deepest detectable contamination. Borings shall be sampled and analyzed at five-foot intervals. EPA 5035 soil sampling guidelines must be utilized. All samples shall be analyzed for BTEX, MTBE, and oxygenate compounds using EPA 8260B, and for gasoline and diesel using EPA 8015(M). A voluntary cleanup oversight fee of $433 must be submitted for the review of future submittals regarding this site.*

   Comment acknowledged. The work plan submitted with this letter addresses the boring depths and required analytical methods. A check for the voluntary cleanup oversight fee of $433 is included with this submittal.

If this letter and the submitted work plan do not sufficiently address the items outlined in the LADPW's June 10, 2004 correspondence, Wohl Property Group and URS would like to schedule a meeting with the LADPW to further discuss any outstanding issues related the site closure efforts. Please contact me directly at (714) 433 - 7622 if you have any questions or comments regarding the responses to LADPW comments and requirements.

Respectfully submitted,
URS Corporation

1.0 INTRODUCTION/SITE BACKGROUND

This Work Plan, prepared by URS Corporation (URS) on behalf of The Realty Associates Fund V, L.P., details the rationale and procedures for conducting additional assessment in the area of removed underground storage tanks (USTs) at the former Hughes Family Market distribution center and warehouse located at 5305 Rivergrade Road in the City of Irwindale, California (Figure 1). The additional assessment was requested by the County of Los Angeles Department of Public Works, Environmental Programs Division (LADPW) in correspondence dated June 10, 2004 (Appendix A).

On July 23, 2003, URS Corporation (URS) removed three 12,000-gallon USTs at the above-referenced property (Site). Two of the three USTs removed were used to store diesel fuel and one was used to store unleaded gasoline (Figure 2). The USTs were double-walled Plasteel with appropriate alarms, spill containment, and overflow protection devices installed to ensure against spills and leaks from the operating systems. These USTs were reportedly installed in 1992 and were last used in 1997-1998. URS personnel conducted the UST removals in accordance with the guidelines and under regulatory oversight of the LADPW.

Per the requirements of the UST closure permit, soil samples were obtained from beneath the removed USTs, product piping, and fuel dispensers using an excavator and/or backhoe. The soil samples were analyzed in a fixed laboratory for total petroleum hydrocarbons as gasoline (TPHg) and diesel fuel (TPHd), by EPA Method 8015M, and for volatile fuel constituents benzene, toluene, ethylbenzene, total xylenes (BTEX) and fuel oxygenates Methyl tert-Butyl Ether (MTBE), Di-isopropyl Ether (DIPE), Ethyl tert-butyl Ether (ETBE), tert-Amyl Methyl Ether (TAME) and tert-Butanol (TBA) by EPA Method 8260B. A summary of the analytical results is provided on Table 1 and the soil sample locations are shown on Figure 2.

Following a review of the laboratory data, additional soil was excavated in the areas of fuel dispenser 1, fuel dispenser 2, satellite fuel dispenser 2, satellite fuel dispenser 3, and below the northern end of UST T2 where soil samples contained concentrations of TPHg or TPHd above 100 mg/kg. The excavation for impacted soil was conducted on August 27, 2003. The objective of this operation was to remove accessible soil affected with petroleum hydrocarbons prior to backfilling and repaving the former UST and fuel dispensing area. Soil was removed to a depth of several feet below the previous soil sampling locations. Specifically the soil beneath fuel dispensers 1 and 2 was removed to a depth of approximately 9½ feet below ground surface (bgs). Soil beneath satellite fuel dispenser 2 was removed to depth of approximately 9½ feet bgs. Soil beneath satellite fuel dispenser 3 was removed to a depth of approximately 8 feet bgs. Soil beneath removed UST T2 was removed to a depth of approximately 21 feet bgs. Following this round of excavation soil samples were taken from the bottom and sides of the excavation to verify soil conditions.

A review of laboratory analytical results for soil samples collected August 27, 2003 indicated further excavation was required in selected areas. This led to additional several feet of soil being removed from the areas of fuel dispenser 1 and fuel dispenser 2 on September 28, 2003. Additional soil was removed from the bottom of the excavation to a depth of approximately 11 feet bgs. Following this round of

excavation soil samples were taken from the excavation areas to confirm that impacted soil was removed from the area. Five samples were collected in the vicinity of the former UST tank number 2. Sixteen samples were collected from beneath the former fuel dispensers at various depths. A summary of the analytical results for the soil samples collected during August 27 and September 28, 2003 is provided in Table 2. The confirmation sample locations are shown on Figure 3.

Approximately 47 tons of petroleum hydrocarbon affected soil excavated from the areas of the UST T2 and fuel dispensers 1 and 2 and satellite fuel dispensers 2 and 3 was transported to Thermal Remediation Solutions in Azusa, California for disposal/recycling.

Confirmatory sampling provided the following results: BTEX and MTBE were not detected at or above laboratory reporting limits in any of the soil samples collected, excluding one sample from beneath UST T2 which contained 0.021 mg/kg of MTBE. However, this sample was re-analyzed for MTBE by EPA method 8260B and the MTBE detection was not confirmed and therefore is not considered valid. TPHg was detected in one soil sample collected beneath fuel dispensers 1 and 2 at concentration of 2.3 mg/kg. TPHd was detected in soil samples at concentrations ranging from 11 mg/kg to 481 mg/kg. It should be noted that additional soil was excavated in the area of the 481 mg/kg detection, and a second confirmation sample collected from this location yielded a non-detect concentration of TPHd.

In summary, confirmation samples collected from the excavations indicate the residual concentrations of TPHd remaining in soil do not exceed 15 mg/kg. Residual concentrations of toluene remaining in soil do not exceed 0.003 mg/kg. Residual concentrations of MTBE remaining in soil do not exceed 0.071 mg/kg (sample T1A-17-030723 collected from below the northern end of UST T1 at a depth of 17 feet bgs). During the field work it was decided that the residual concentrations could not be easily removed because the excavation was caving in and undermining the concrete slab adjacent to the excavation.

URS prepared a UST Removal Project Report dated November 3, 2003 for submittal to the LADPW which described the UST removal and soil excavation project in further detail. Following review of the UST Removal Project Report the LADPW issued a letter dated June 10, 2004 with additional closure requirements for the Site (Appendix A). The additional closure requirements for the site include "submit(ting) a work plan to define the lateral and vertical extent of contamination" and completing borings to minimum depth of 25 feet below the deepest detectable compound (or first groundwater)".

We have reviewed the data and believe the lateral extent of soil impacted with petroleum hydrocarbons and fuel oxygenates in the areas of the removed USTs and dispensers was effectively defined during the UST removal and soil excavation project conducted in 2003 and is detailed in the UST Removal Project Report (URS, Nov. 2003). It is the opinion of The Realty Associates Fund V, L.P. and URS that no further assessment of the lateral impact of petroleum hydrocarbons and fuel oxygenates in the areas of the removed USTs and dispensers should be required. Haley & Aldrich, Inc. contacted LADPW on behalf of The Realty Associates Fund V, L.P. to discuss the focus of the additional assessment. It is URS' understanding based on information provided from Haley & Aldrich, Inc. that the LADPW is concerned about the potential threat to groundwater resources from residual MTBE concentrations remaining in shallow subsurface soils at the Site.

The purpose of the additional assessment proposed in this Work Plan is to further define the vertical extent of MTBE impacted soil in the areas of removed UST T1 and UST T2. These locations were targeted because; 1) the area beneath removed UST T1 has the highest residual concentration of MTBE at 0.071 mg/kg at a depth of 17 feet bgs. and 2) UST T2 previously had elevated concentrations of TPHd and MTBE. although impacted soil was excavated from this area and confirmation samples collected contained non-detectable (ND) concentrations of TPHg. TPHd. BTEX and fuel oxygenates. Due to the existing canopy. these proposed boring locations are also the closest that a conventional drilling rig can get to removed fuel dispensers FD5 and FD6 where low detections of MTBE in residual shallow soil remain (0.05 and 0.014 mg/kg). This Work Plan is being submitted in response to the LADPW's additional closure requirements for the Site. The data collected from the additional assessment will be used to evaluate the Site for regulatory closure.

2.0 GEOLOGY AND HYDROGEOLOGY

The Site is located the northern half of the San Gabriel Valley approximately 3½ miles from the southern flank for the San Gabriel Mountains. The Site is bounded by the San Gabriel Riverbed to the northwest, by Rivergrade Road to the south and southeast, by Arrow Highway to the northeast, by the 605 Freeway to the west. The Santa Fe Flood Control Basin is located directly north of the Site.

Recent alluvium composed of unconsolidated deposits of gravel and sand occurs at ground surface in the area of the Site. Soil encountered in the UST excavations consisted of sands with gravel that caved easily during excavation. Boring log data for the vicinity indicates that primarily gravel or gravel and sand are present to the total depths of 300 to 500 feet bgs in the site vicinity. Boulders and cobbles are also present in shallow subsurface soils. Alluvial deposits consisting primarily of gravel, sand, silt, and clay are estimated to extend to depths of 1,000 to 2,000 feet bgs in the Site vicinity. Idealized cross-sections indicate the middle and upper Miocene age Puente and Topanga Formations underlie the alluvial deposits to undetermined depths. The Topanga and Puente Formations are marine deposits consisting of interbedded siltstones, sandstones, conglomerates, and shale (State of California DWR, 1966).

Hydrogeologically, the Site is located in the central area of the San Gabriel Valley groundwater basin. The basin is bounded on the north by the San Gabriel Mountains, on the east by uplifted subsurface bedrock between San Dimas and La Verne, on the southeast, south and west by the San Jose, Puente, Merced, and Repetto Hills, and on the northwest by the Raymond fault. The primary water bearing formations within the basin consist of unconsolidated and semi-consolidated Holocene and Pleistocene age sediments (State of California DWR, 1966).

Los Angeles County Well #4239H is located approximately 1700 feet southeast of the Site (Figure 1). Depth to groundwater in the well was last measured May 1, 2003 at 214.2 feet bgs (LADPW, September 2003). Based on this data, the depth to groundwater beneath the Site is estimated to be approximately 200 feet bgs. Based on the regional topography the direction of groundwater flow in the Site vicinity is estimated to be south-southwest.

3.0 SCOPE OF WORK

The project will be managed and field activities supervised by URS personnel under the direction of a California Registered Geologist. Methods to be utilized during the Limited Phase II Assessment are provided in the following sections.

3.1 HEALTH AND SAFETY PLAN

Prior to initiating the field activities, a site-specific health and safety plan will be prepared that:

- Identifies and describes potentially hazardous substances that could be encountered during field operations.
- Specifies protective equipment and clothing for onsite activities.
- Outlines measures to be implemented in the event of an emergency.

Field personnel will be required to review the health and safety plan prior to commencing with field activities. In addition, health and safety briefings will be conducted during the course of field activities. A copy of the health and safety plan will be kept onsite during field activities and will be archived in the project files upon completion of the field work.

3.2 UTILITY CLEARANCE

In accordance with California Assembly Bill AB 73, Underground Services Alert (USA) will be notified of our intent to conduct subsurface excavation at least 48 hours prior to initiation of intrusive field tasks. The proposed location of subsurface excavation will be clearly marked with white paint as required by California Code 4216. USA will contact utility owners of record within the vicinity and notify them of our intent to conduct subsurface excavation in proximity to buried utilities. The utility owners of record, or their designated agents, will clearly mark the position of their utilities on the ground surface throughout the area designated for drilling activities.

3.3 SOIL BORINGS AND SAMPLE COLLECTION

Two soil borings will be drilled to a target depth of 50 to 60 feet below ground surface (bgs) in the vicinity of the removed USTs to assess the vertical extent of petroleum hydrocarbon impacts (particularly MTBE) at the Site. One boring will be located at the northern end of UST T1 and one boring will be located at the northern end of UST T2. The proposed boring locations are shown on Figure 4.

Sonic drilling is the proposed method for reaching the target depths of 50 to 60 feet bgs. Drilling contractors were contacted by URS to discuss appropriate drilling methods for the Site. Due to Site's proximity to the San Gabriel Mountains subsurface soils in the site vicinity contain a large percentage of cobbles and boulders. Hollow stem auger (HSA) drill rigs commonly used for subsurface drilling and sampling in the Los Angeles Basin have encountered drill refusal at depths less than 10 feet bgs in the Site vicinity. Sonic drilling consists of advancing drill pipe utilizing high speed vibration and low speed

rotation combined with down-pressure. This drilling method is often successful in drilling through course unconsolidated geologic formations comprised of cobbles and boulders.

Core samples will be collected from the boring adjacent to the canopy and east of former fuel dispensers 1 and 2 at five foot intervals beginning at five feet bgs. Core samples will be collected from the boring at the northern end of removed UST T2 at five foot intervals beginning at a depth of 25 feet bgs (soil analytical data for the upper 21 feet in this area was collected during the soil excavation activities). The soil cores will be logged using the Unified Soil Classification System (USCS) and screened in the field for VOCs using a Photo Ionization Detector (PID). Soil boring logs including PID screening results will be provided in the project report.

Soil samples to be analyzed for volatile organic compounds (VOCs) will be collected from the sample cores using Encore™ samplers in accordance with EPA method 5035 protocol required by the Regional Water Quality Control Board, Los Angeles Region (RWQCB). Soil samples will be properly sealed, labeled, and recorded on a chain of custody document. The sample labels affixed to the samples will include the following information; sample designation, sample number, sample depth, date, collector initials, site/client name, and time of collection. The sealed and labeled samples will placed in an ice chest maintained at a temperature of three to seven degrees centigrade and transported, under chain of custody, to a California Department of Health Services accredited laboratory for analysis. Completed chain of custody documents will be provided in the project report.

Sampling equipment will cleaned after each sampling interval by washing with a dilute Alconox solution followed by rinsing with fresh water, final rinsing with distilled water, and air-drying.

3.4 Laboratory Analytical Program

The soil samples will be analyzed for TPHg and TPHd by EPA Method 8015M. The soil samples will also be analyzed for BTEX and the fuel oxygenate MTBE by EPA Method 8260B.

3.5 Waste Management

Investigation derived waste generated during the drilling program will be placed in 55-gallon UN-approved drums. The drums will be properly labeled with the date, contents, and generator information and temporarily stored onsite. The drums will be profiled for disposal at an appropriate facility following receipt of laboratory analytical results. Waste disposal documentation will be provided in the project report.

3.6 Backfill And Resurfacing

The soil borings will be backfilled with hydrated bentonite chips resurfaced with concrete.

4.0 REPORT PREPARATION

Data collected during the limited phase II assessment will be used to prepare a project report signed by a registered geologist that will include the following:

- Descriptions of field investigation methods.
- Boring logs
- Laboratory Analytical Reports and Chain of Custody documents.
- Tables summarizing analytical results.
- Site maps showing boring locations.
- Waste disposal documentation.
- Findings and conclusions regarding the vertical impacts of petroleum hydrocarbons at the site.
- A Site closure analysis based on LADPW and RWQCB guidelines.

5.0 SCHEDULE

The tentative schedule to complete the limited phase II assessment is as follows:

- LADPW approval of the Work Plan - April 10, 2005
- Completion of Field Drilling Program - April 30, 2005
- Submittal of Project Report to LADPW - May 31, 2005

The schedule may be revised, as necessary, throughout the project.

6.0 LIMITATIONS

This work plan is intended exclusively for the purpose outlined herein and the Site location and project indicated. This work plan was prepared for the sole use and benefit of The Realty Associates Fund, V L.P. The scope of services performed in execution of this project may not be appropriate to satisfy the needs of other users, and any use or reuse of this document or the findings, conclusions, or recommendations presented herein is at the sole risk of said user.

Opinions relating to environmental, geologic, and geotechnical conditions are based on limited data and actual conditions may vary from those encountered at the times and locations where data were obtained. No express or implied representation or warranty is included or intended in this work plan except that the work was performed within the limits prescribed by The Realty Associates Fund V, L.P. with the customary thoroughness and competence of professionals working in the same area on similar projects.

Please contact us at (714) 835-6886 if you have any comment or questions.

Respectfully submitted,

URS CORPORTATION

J.S. Rowlands, R.G., C.HG.
Principal Geologist

S. Tariq Hussain
Project Manager

CLOSURE REPORT
CLOSURE PERMIT NUMBER 373090
FACILITY LOCATION: 5305 NORTH RIVERGRADE ROAD, IRWINDALE

This office has reviewed the closure report dated November 3, 2003, for the subject facility.

In order to better evaluate the report, the information indicated on the enclosed Additional Closure Requirements sheet must be submitted to this office by August 18, 2004.

If you have any questions regarding this matter, please contact Mr. Andrew Ngumba, of this office, at (626) 458-3513, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

JAMES A. NOYES

ADDITIONAL CLOSURE REQUIREMENTS

The additional information or requirements checked below must be submitted to the County of Los Angeles Department of Public Works, Environmental Programs Division, P.O. Box 1460, Alhambra, CA 91802-1460, in order to complete evaluation of Closure Permit No. 373090.

[ ] Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets, and north arrow.

[ ] Insufficient number of samples was obtained. Additional samples required in accordance with attached Closure Permit Requirements.

[ ] Describe method of obtaining, handling, and/or transporting samples.

[ ] Indicate time and date samples were obtained.

[X] Submit logs certified by a CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils for all borings.

[ ] Submit chain-of-custody documentation initiated by person obtaining sample through person at Department of Health Services certified laboratory.

[ ] Disposal destination of tanks and evidence of legal disposal.

[ ] Analysis results by a State certified laboratory shall be submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

[ ] Documentation as to depth of groundwater at facility.

[ ] Manifests to document hazardous waste disposal of removed soil/tank rinsate with the signature of the disposal facility owner/operator.

[ ] Evidence of legal disposal of soils designated as non-hazardous.

[X] Signature on the report is required of CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils. The report must clearly indicate that all soil sampling was done under the supervision of the registered professional.

[X] Submit a work plan to define the lateral and vertical extent of contamination.

[X] Complete borings to groundwater or complete borings which penetrate to a minimum depth of 25 feet below the deepest detectable contamination. Borings shall be sampled and analyzed at five-foot intervals. EPA 5035 soil sampling guidelines must be utilized. All samples shall be analyzed for BTEX, MTBE, and oxygenate compounds using EPA 8260B, and for gasoline and diesel using EPA 8015(M). A voluntary cleanup oversight fee of $443 must be submitted for the review of future submittals regarding this site.

HAZARDOUS MATERIALS UNDERGROUND STORAGE TANKS
LANDOWNER NOTIFICATION AND PARTICIPATION REQUIREMENTS
FACILITY LOCATION: 5305 NORTH RIVERGRADE ROAD, IRWINDALE

This letter is to inform you of legislative requirements pertaining to cleanup and closure of sites where an unauthorized release of hazardous substance, including petroleum, has occurred from an underground storage tank (UST). Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code requires the primary or active responsible party to notify all current record owners of fee title to the site of: 1) a site cleanup proposal, 2) a site closure proposal, 3) a local agency intention to make a determination that no further action is required, and 4) a local agency intention to issue a closure letter. Section 25297.15(b) requires the local agency to take all reasonable steps to accommodate responsible landowners' participation in the cleanup or site closure process and to consider their input and recommendations.

For purposes of implementing these sections, you have been identified as the primary or active responsible party. Please provide to this agency, within 20 calendar days of receipt of this notice, the assessor parcel number(s) for the site and a complete mailing list of all current record owners of fee title to the site. You may use the enclosed list of landowners form (sample letter 2) to comply with this requirement. If the list of current record owners of fee title to the site changes, you must notify the local agency of the change within 20 calendar days from when you are notified of the change.

If you are the sole landowner, please indicate that on the landowner list form. The following notice requirements do not apply to responsible parties who are the sole landowner for the site.

In accordance with Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code, you must certify to the local agency that all current record owners of fee title to the site have been informed of the proposed action before the local agency may do any of the following:

1) Consider a cleanup proposal (corrective action plan)
2) Consider a site closure proposal
3) Make a determination that no further action is required
4) Issue a closure letter

You may use the enclosed notice of proposed action form (sample letter 3) to comply with this requirement. Before approving a cleanup proposal or site closure proposal, determining that no further action is required, or issuing a closure letter, the local agency will take all reasonable steps necessary to accommodate responsible landowner participation in the cleanup and site closure process and will consider all input and recommendations from any responsible landowner.

Please submit the certification within 20 days from the date of this letter. June 30 Th

Initial voluntary cleanup oversight fee of $443 must be paid prior to any report review. An additional fee of $147 per hour will be charged for each hour of assessment review which exceeds the initial three-hour review estimation.

Should you have any questions regarding this matter, please contact Mr. Andrew Ngumba, of this office, at (626) 458-3513, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

Re: Former Hughes Family Market at 5305 Rivergrade Road, Irwindale, California (CUPA No. W819505)

Dear Ms. Flores

Enclosed, please find a copy of the proposed work plan for the subject site for your review and approval. This work plan has been developed in response to the LADPW letter dated June 10, 2004, and electronic correspondence dated June 13, 2005. We trust that the enclosed work plan is adequate and meets your requirements. If you have any questions or concerns, please feel free to contact me at (805) 388-3775.

Sincerely,

Robert Baca
Senior Project Manager

1.0 INTRODUCTION

This Site Assessment (SA) Workplan has been prepared for the former Family Hughes Market (Site) distribution center and warehouse, located at 5305 Rivergrade Road in Irwindale, California. The general location of the Site is shown on Figure 1 – Site Location Map. This SA Workplan is being submitted by ENSR on behalf of The Realty Associates Fund V, L.P. (T.A. Realty) in response to correspondence from the Los Angeles County Department of Public Works (LADPW) Environmental Programs Division dated June 13, 2005 requesting vertical and lateral delineation of hydrocarbon-impacted soil.

2.0 SITE BACKGROUND

2.1 Site Status/Site History

The Site operated a gas station on-site to serve the requirements of company vehicles. The USTs associated with the gas station were used from 1992 to 1997-1998. The San Gabriel River is located northwest of the Site, while Rivergrade Road, Arrow Highway, and Interstate 605 are located south, northeast, and west, respectively.

The Site was sold to the Ralph's Grocery chain and was later sold the T.A. Realty. Two 12,000-gallon diesel double-walled Plasteel USTs, one 12,000-gallon gasoline double-walled Plasteel UST, fuel dispensers, and associated piping were removed by TA Realty on July 23, 2003 (URS 2003). Observations made during the UST removal did not detect damage or leakage from the USTs. Soil surrounding the USTs did not exhibit discoloration or odor (URS 2003).

Six soil samples were collected beneath the former locations of the USTs at a depth of approximately 17 feet below ground surface (bgs) (Figure 2). Ten soil samples were collected beneath the former locations of the fuel dispensers at depths ranging from 3 to 4 feet bgs. Three soil sampling were collected beneath the former locations of the piping at depths of approximately 3 to 5.5 feet bgs.

Total petroleum hydrocarbons as gasoline (TPH-g) was detected in four soil samples collected beneath fuel dispensers 1 and 2 and satellite fuel dispensers 2 and 3 at concentrations ranging from 1 to 305 mg/kg. Total petroleum hydrocarbons as diesel (TPH-d) was detected in seven soil samples collected beneath fuel dispensers 1, 2, and 5, satellite fuel dispensers 2 and 3, and UST T2 at concentrations ranging from 10 to 6,370 mg/kg. Toluene was detected in one soil sample collected beneath dispenser 5 (FD5-4) at a concentration of 0.003 milligrams per kilogram (mg/kg). Methyl tert-butyl ether (MTBE) was detected at concentration ranging from 0.014 to 0.071 mg/kg in soil samples collected beneath dispenser 5 (FD5-4) and the tank 1 excavation (T1A-17), respectively. Benzene, ethylbenzene, xylenes, and oxygenate compounds were not detected in soil samples collected during the excavation activities.

Additional soil was excavated following review of the laboratory results on August 27, 2003 (URS 2003). Soil was excavated in the vicinity of the former locations of dispensers 1 and 2 to depths of approximately 9.5 feet bgs, satellite dispenser 2 to a depth of approximately 9.5 feet bgs, satellite dispenser 3 to a depth of approximately 8 feet bgs, and UST T2 to a depth of approximately 21 feet bgs. Soil samples collected during this excavation event did not contain detectable concentrations of benzene, toluene, ethylbenzene, or xylenes (BTEX). MTBE was detected in one soil sample collected beneath T2A at a concentration of 0.021 mg/kg. Another analysis was run to confirm the presence of MTBE, however, and results indicated no detectable concentrations of MTBE. The previous results were therefore not considered valid (URS 2003). One soil sample (collected beneath fuel dispensers 1 and 2) contained TPH-g and TPH-d at concentrations of 2.3 and 481 mg/kg, respectively (URS 2003).

On September 28, 2003, a third excavation was performed in the vicinity of the former locations of dispensers 1 and 2 to a depth of approximately 11 feet bgs to remove residual impacts detected during the previous excavation. TPH-d concentrations did not exceed 15 mg/kg, and MTBE concentrations did not exceed 0.071 mg/kg. Residual hydrocarbon concentrations were below preliminary

remediation goals (PRGs) for industrial soil. Based on confirmation soil sampling following this final excavation event, URS (2003) recommended that additional excavation would undermine the concrete slab adjacent to the fieldwork, and that no further excavation be necessary. In all, 47 tons of soil was excavated and transported off-site for disposal. The excavations were backfilled with clean, imported fill and resurfaced with six inches of steel-reinforced concrete.

The LADPW responded to TA Realty in a letter dated June 10, 2004, that additional assessment was required to evaluate the presence of hydrocarbon-impacted soil (Appendix A). In March 2005, URS, on behalf of TA Realty, submitted a workplan to the LADPW proposing two soil borings in the vicinity of UST T1 and UST T2. In electronic correspondence dated June 13, 2005, the LADPW indicated that the subsurface assessment should include ten soil borings in the vicinity of UST T1, UST T2, and the fuel dispenser.

2.2 Site Geology and Hydrogeology

The Site is located in the northern half of the San Gabriel Valley and approximately 3.5 miles south of the San Gabriel Mountains. Soil beneath the Site consists primarily of alluvium deposits consisting of unconsolidated gravel and sand (URS 2003). Previous assessments show that sand and gravel extend to depths greater than 500 feet bgs. The sand and gravel deposits are underlain by older alluvial deposits consisting of gravel, sand, silt, and clay to depths greater than 2,000 feet bgs. The middle and upper Miocene Puente and Topanga Formations underlie the alluvial deposits to an unknown depth.

The Site is located in the central area of the San Gabriel Valley groundwater basin. The basin is bounded to the north by the San Gabriel Mountains, to the south and west by the San Jose, Puente, Merced, and Repetto Hills, to the northwest by the Raymond fault, and to the east by uplifted bedrock. The principle water bearing units consist of unconsolidated and semi-consolidated alluvial sediments.

The nearest municipal well to the Site is Los Angeles County Well No. 4239H, located approximately 1,700 feet to the southeast (Figure 1). Depth to water measurements in 2003 indicate that groundwater beneath the Site is approximately 200 feet bgs. The gradient and flow direction of the shallow aquifer is not known, but the regional topography suggests that groundwater flows to the south-southwest.

3.0 FIELD SAMPLING PLAN

3.1 Underground Utility Clearance

The proposed boring locations will be marked in white spray paint, survey flags, or wooden stakes. ENSR will then contact Underground Service Alert (USA) to locate and mark the underground utilities serving the subject property. In addition, the proposed boring locations will be independently delineated to approximately 8 feet bgs for underground utilities through the use of an air knife rig.

3.2 Health and Safety Plan

A Health and Safety Plan (HASP) has been prepared for the on-site activities. The HASP provides an assessment of known hazards and evaluations of the risks associated with conducting the field work at the subject property. Available site information has been examined to select and implement appropriate warnings and safeguards for field personnel. A copy of the HASP is included in Appendix B.

3.3 Permits

Permits will not be required for the scope of work because the soil borings will not encounter water nor will the proposed boring locations encroach on public right of way.

3.4 Soil and Groundwater Sampling Rationale

On March 21, 2005, URS submitted a workplan on behalf of TA Realty to the LADPW proposing two confirmation soil borings in the vicinity of UST T1 and UST T2 in preparation for site closure. LADPW, in electronic correspondence dated June 13, 2005, stated that they required ten soil borings in the vicinity of the USTs and fuel dispensers to evaluate the vertical and lateral extent of hydrocarbon-impacted soil. In accordance with the LADPW requirements, the ten proposed soil boring locations will evaluate the presence and extent of residual petroleum hydrocarbons and oxygenates in the vicinity of the former locations of the USTs, fuel dispensers, and associated piping.

Soil borings SB-1 will be locate five feet north of USTs T1 and T2 and will evaluate the vertical extent of petroleum hydrocarbons. Soil borings SB-2 through SB-4 will evaluate the vertical extent of petroleum hydrocarbons beneath satellite dispenser 2, fuel dispensers 1 and 2, and satellite dispenser 3, respectively. Soil borings SB-5 through SB-7 will be located around the perimeter of the assessment area to evaluate the horizontal extent of petroleum hydrocarbons.

3.5 Soil Borings, Soil Sampling and Handling Procedures

ENSR will use a hydraulically operated truck-mounted hollow stem auger drill rig to advance and sample seven soil borings at the site (approximate locations on Figure 3). Soil samples will be collected at five foot intervals to the total depth of each boring. Soil sampling for boring SB-1 will begin at approximately 20 feet bgs because the tank excavations advanced to a depth of approximately 21 feet bgs and extend to a minimum depth of approximately 40 feet bgs to confirm vertical delineation of petroleum hydrocarbons. Soil sampling for SB-2 through SB-4 will begin at approximately 10 feet bgs

and extend to a minimum depth of approximately 30 feet bgs to confirm vertical delineation of petroleum hydrocarbons beneath the fuel dispensers. Soil sampling for SB-5 through SB-7 will begin at approximately 10 feet bgs and end at approximately 40 feet bgs to confirm horizontal delineation of petroleum hydrocarbons.

The soil samples will be selected in accordance with the sampling plan summarized in Table 1 (Standard Operating Procedures for soil sampling by split spoon are located in Appendix C). It should be noted, that based on field observations of obvious impacts, additional soil samples may be collected and analyzed to properly characterize the nature of observed impacts.

Soil and groundwater samples will be labeled sequentially, 1, 2, 3, etc... with the prefix "SB" to represent the soil boring location they are taken from. Each soil sample will also be labeled with the depth at which it was taken; for example, the soil sample collected at a depth of five feet bgs from boring SB-1 would be labeled as SB-1-5. If refusal is encountered in a boring and the boring is relocated to avoid the subsurface obstruction, the relocated boring will be identified with the original boring number using an upper case letter suffix (i.e. SB-1-5A). If refusal continues to be encountered in the soil borings, ENSR will use a sonic drill rig to advance the soil borings through large cobbles and boulders.

Soil samples will be collected using a stainless steel split spoon sampler fitted with three, six-inch long pre-cleaned brass or stainless steel sampling sleeves. The split spoon sampler will be driven into undisturbed soil ahead of the lead auger by a 140-pound down-hole hammer.

The samples will be field screened for the presence of VOCs using a field photoionization detector (PID) and observed for visual impacts and olfactory evidence of contamination. The soil samples collected from the borings will be collected in brass sample sleeves, the ends of which will be covered in Teflon® tape and capped with plastic end caps. The soil samples that will be analyzed for VOCs, TPH-g, and TPH-d will be extracted and preserved in accordance with EPA Method 5035. The sample containers will be sealed, labeled, recorded on a chain-of-custody (COC) form and placed in ice chests pending delivery to the analytical laboratory.

3.6 Quality Assurance/Quality Control

ENSR will collect duplicate or collocated replicate soil samples equal to ten percent of the total number of samples collected during the project. One trip blank per cooler will accompany the samples to the laboratory for quality control/quality assurance (QA/QC) purposes.

3.7 Laboratory Analysis

Soil and groundwater samples will be analyzed by a California-certified hazardous waste testing laboratory by EPA Method 8015 for TPH-g and TPH-d, and EPA Method 8260B for BTEX and oxygenates.

3.8 Investigation Derived Wastes

Soil cuttings generated from the drilling activities will be placed in Department of Transportation (DOT) approved 55-gallon drums or roll-off bins, labeled appropriately, and stored on-site pending the receipt of laboratory analytical results. Following receipt of the analytical results and confirmation that the soil

is not considered hazardous, the soil will transported to an appropriate disposal facility. If the soil is determined to be hazardous, it will be transported off-site for disposal at an appropriately permitted facility.

Decontamination (decon) water and purge water generated by sampling activities will also be stored on-site in DOT-approved 55-gallon drums. Following receipt of the analytical results and confirmation that the decon water is not hazardous, the water will be disposed of on-site. If the decon water is determined to be hazardous, the water will be transported offsite for disposal at an appropriately permitted facility.

4.0 REPORTING

Upon completion of the field activities and receipt of the final laboratory analytical results, a technical report summarizing the results of this project will be prepared for submittal to the LADPW. The report will be prepared under the supervision of and signed by a California Professional Geologist. The report will summarize field activities and observations. It will document any variances from this Work Plan that were required in the field. The report will also summarize the laboratory analytical results obtained and include copies of the certified laboratory analytical transcripts provided by the analytical laboratory. The report will summarize the results and QA/QC efforts and present ENSR's conclusions based on the available information. Finally, the report will present our recommendations regarding the need for additional assessment or for site closure, as applicable.

		SB-7-35	35	TPH-g, TPH-d, BTEX, Oxygenates
		SB-7-40	40	TPH-g, TPH-d, BTEX, Oxygenates

Notes:

All depths are reported in feet below ground surface.

Sampling depth to be analyzed assumes that there are no significant PID readings (greater than 25 PPM) or visual or olfactory - evidence of contamination. Evidence of elevated PID readings would call for sampling at that depth.

TPH-g - Total petroleum hydrocarbons as gasoline analyzed by EPA Method 8015M.

TPH-d - Total petroleum hydrocarbons as diesel analyzed by EPA Method 8015M.

BTEX - Benzene, toluene, ethylbenzene, xylenes analyzed by EPA Method 8260B.

ADDITIONAL CLOSURE REQUIREMENTS

The additional information or requirements checked below must be submitted to the County of Los Angeles Department of Public Works, Environmental Programs Division, P.O. Box 1460, Alhambra, CA 91802-1460, in order to complete evaluation of Closure Permit No. 373090.

[ ] Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets, and north arrow.

[ ] Insufficient number of samples was obtained. Additional samples required in accordance with attached Closure Permit Requirements.

[ ] Describe method of obtaining, handling, and/or transporting samples.

[ ] Indicate time and date samples were obtained.

[X] Submit logs certified by a CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils for all borings.

[ ] Submit chain-of-custody documentation initiated by person obtaining sample through person at Department of Health Services certified laboratory.

[ ] Disposal destination of tanks and evidence of legal disposal.

[ ] Analysis results by a State certified laboratory shall be submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

[ ] Documentation as to depth of groundwater at facility.

[ ] Manifests to document hazardous waste disposal of removed soil/tank rinsate with the signature of the disposal facility owner/operator.

[ ] Evidence of legal disposal of soils designated as non-hazardous.

[X] Signature on the report is required of CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils. The report must clearly indicate that all soil sampling was done under the supervision of the registered professional.

[X] Submit a work plan to define the lateral and vertical extent of contamination.

[X] Complete borings to groundwater or complete borings which penetrate to a minimum depth of 25 feet below the deepest detectable contamination. Borings shall be sampled and analyzed at five-foot intervals. EPA 5035 soil sampling guidelines must be utilized. All samples shall be analyzed for BTEX, MTBE, and oxygenate compounds using EPA 8260B, and for gasoline and diesel using EPA 8015(M). A voluntary cleanup oversight fee of $443 must be submitted for the review of future submittals regarding this site.

HAZARDOUS MATERIALS UNDERGROUND STORAGE TANKS
LANDOWNER NOTIFICATION AND PARTICIPATION REQUIREMENTS
FACILITY LOCATION: 5305 NORTH RIVERGRADE ROAD, IRWINDALE

This letter is to inform you of legislative requirements pertaining to cleanup and closure of sites where an unauthorized release of hazardous substance, including petroleum, has occurred from an underground storage tank (UST). Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code requires the primary or active responsible party to notify all current record owners of fee title to the site of: 1) a site cleanup proposal, 2) a site closure proposal, 3) a local agency intention to make a determination that no further action is required, and 4) a local agency intention to issue a closure letter. Section 25297.15(b) requires the local agency to take all reasonable steps to accommodate responsible landowners' participation in the cleanup or site closure process and to consider their input and recommendations.

For purposes of implementing these sections, you have been identified as the primary or active responsible party. Please provide to this agency, within 20 calendar days of receipt of this notice, the assessor parcel number(s) for the site and a complete mailing list of all current record owners of fee title to the site. You may use the enclosed list of landowners form (sample letter 2) to comply with this requirement. If the list of current record owners of fee title to the site changes, you must notify the local agency of the change within 20 calendar days from when you are notified of the change.

If you are the sole landowner, please indicate that on the landowner list form. The following notice requirements do not apply to responsible parties who are the sole landowner for the site.

In accordance with Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code, you must certify to the local agency that all current record owners of fee title to the site have been informed of the proposed action before the local agency may do any of the following:

1) Consider a cleanup proposal (corrective action plan)
2) Consider a site closure proposal
3) Make a determination that no further action is required
4) Issue a closure letter

You may use the enclosed notice of proposed action form (sample letter 3) to comply with this requirement. Before approving a cleanup proposal or site closure proposal, determining that no further action is required, or issuing a closure letter, the local agency will take all reasonable steps necessary to accommodate responsible landowner participation in the cleanup and site closure process and will consider all input and recommendations from any responsible landowner.

Please submit the certification within 20 days from the date of this letter. June 30 Th

Initial voluntary cleanup oversight fee of $443 must be paid prior to any report review. An additional fee of $147 per hour will be charged for each hour of assessment review which exceeds the initial three-hour review estimation.

Should you have any questions regarding this matter, please contact Mr. Andrew Ngumba, of this office, at (626) 458-3513, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

JAMES A. NOYES

1. INTRODUCTION

1.1. Purpose

This Health and Safety Plan (HASP) has been developed by ENSR Corporation (ENSR) to minimize potential risk to personnel involved in drilling and soil sampling in Irwindale, California. The provisions of this HASP apply to ENSR personnel who will be potentially exposed to safety and/or health hazards associated with the remediation tasks outlined in Section 3.0 of this HASP. This HASP has been written to comply with OSHA's Hazardous Waste Operations and Emergency Response Standard (29 CFR 1910.120) and the OSHA Personal Protective Equipment regulations (29 CFR 1910.132). All activities covered by this HASP must be conducted in complete compliance with all applicable federal, state and local health and safety regulations. Personnel covered by this HASP who cannot or will not comply with these requirements will be excluded from site activities

1.2. Modifications

Every effort has been made to address the hazards associated with the types of chemical contamination that may be encountered at this various site being investigated by ENSR. Similarly, this document also discusses the physical hazards associated with the typical types of activities that may be performed by ENSR employees during site groundwater sampling. Unanticipated site-specific conditions or situations may occur during the implementation of the proposed site remediation that are not addressed in this document. As such, this HASP must be considered a working document that is subject to change to meet the needs of each site remediation.

Prior to the start of work, the Project Manager (PM) or Field Technician will review with the Regional Health and Safety Manager (RHSM), the scope of work and the expected nature and extent of contamination at the site. If unique site hazards are present or different tasks are proposed that have not been addressed in this HASP, it will be necessary to modify this HASP. All proposed modifications to this HASP must be reviewed and approved by the RHSM before such modifications are implemented in the field. Modifications to the HASP will be incorporated into the document as addenda.

1.3. Approval and Dissemination

All ENSR personnel covered by this HASP must read a copy of it and return the HASP signoff sheet (Attachment A) to the ENSR Site Safety Officer (SSO) prior to the start of on-site activities.

1.4. Responsibilities

The implementation of health and safety at this project location will be the shared responsibility of the ENSR Project Manager (PM), the ENSR Regional Health and Safety Manager (RHSM), the ENSR Project Site Safety Officer (SSO) and all other ENSR personnel.

1.4.1. Project Manager

The ENSR Project Manager, Bob Baca, is responsible for ensuring that the requirements of this HASP are implemented at that project location. Some of the PM's specific responsibilities include:

- Assuring that all personnel to whom this HASP applies have received a copy of it;
- Providing the RHSM with updated information regarding environmental conditions at the site and the scope of site work;
- Providing adequate authority and resources to the on-site SSO to allow for the successful implementation of all necessary safety procedures;
- Supporting the decisions made by the SSO and RHSM;
- Maintaining regular communications with the SSO and, if necessary, the RHSM;
- Providing project scheduling and planning activities.

1.4.2. Regional Health and Safety Manager

The ENSR RHSM (John Shepard) is the individual responsible for the preparation, interpretation and modification of this HASP. Modifications to this HASP which may result in less stringent precautions cannot be undertaken by the PM or the SSO without the approval of the RHSM. Specific duties of the RHSM include:

- Writing, approving and amending the HASP for this project;
- Advising the PM and SSOs on matters relating to health and safety;
- Recommending appropriate personal protective equipment (PPE) and air monitoring instrumentation; and
- Maintaining regular contact with the PM and SSO to evaluate the conditions at the property and new information which might require modifications to the HASP.

1.4.3. Site Safety Officer

All ENSR field technicians are responsible for implementing the safety requirements specified in this HASP. However, one field technician will serve as the SSO at each site. The SSO will be appointed by the PM for this site. The SSO will be on-site during all activities covered by this HASP. The SSO is responsible for enforcing the requirements of this HASP once work begins.

The SSO has the authority, and the responsibility, to immediately correct all situations where noncompliance with this HASP is noted and to immediately stop work in cases where an immediate danger is perceived. Some of the SSO's specific responsibilities include:

- Assuring that all personnel to whom this HASP applies have submitted a completed copy of the HASP sign-off form;
- Assuring that all personnel to whom this HASP applies have attended a pre-entry briefing prior to entering a restricted area;
- Maintaining a high level of health and safety consciousness among employees at the work site;
- Procuring and distributing the PPE needed for this project for ENSR employees;
- Procuring the air monitoring instrumentation required and performing air monitoring for ENSR activities;
- Verifying that all PPE and health and safety equipment is in good working order;
- Setting up and maintaining the cleanup zone within the restricted areas and assuring proper cleanup of all site personnel;
- Notifying the PM of all noncompliance situations and stopping work in the event that an immediate danger situation is perceived;
- Monitoring and controlling the safety performance of all personnel within the established restricted areas to ensure that required safety and health procedures are being followed and correcting any deficiencies;
- Conducting accident/incident investigations and preparing accident/incident investigation reports;
- Conducting the pre-entry briefing as required by Section 10.3 of the HASP; and,
- Initiating emergency response in accordance with Section 12.0 of this HASP.

1.4.4. Field Personnel

All ENSR field personnel are responsible for following the health and safety procedures specified in this HASP and for performing their work in a safe and responsible manner. Some of the specific responsibilities of the field personnel are as follows:

- Reading the HASP in its entirety prior to the start of on-site work;
- Submitting a completed HASP Acceptance Form and documentation of medical surveillance and training to the SSO prior to the start of work;
- Attending the pre-entry briefing prior to beginning on-site work;
- Bringing forth any questions or concerns regarding the content of the HASP to the PM or the SSO prior to the start of work;
- Reporting all accidents, injuries and illnesses, regardless of their severity, to the ENSR SSO; and,

- Complying with the requirements of this HASP and the requests of the SSO.

2. SITE HISTORY / DESCRIPTION

The Site operated a gas station on-site to serve the requirements of company vehicles. The USTs associated with the gas station were used from 1992 to 1997-1998. The San Gabriel River is located northwest of the Site, while Rivergrade Road, Arrow Highway, and Interstate 605 are located south, northeast, and west, respectively.

The Site was sold to the Ralph's Grocery chain and was later sold the T.A. Realty. Since T.A. Realty did not require a gas station on their property, they decided to remove the underground storage tanks (USTs), dispensers, and associated piping. Two 12,000-gallon diesel double-walled Plasteel USTs, one 12,000-galion gasoline double-walled Plasteel UST, fuel dispensers, and associated piping were removed on July 23, 2003 (URS 2003). Observations made during the UST removal did not detect damage or leakage from the USTs. Soil surrounding the USTs did not exhibit discoloration or odor.

Six soil samples were collected beneath the former locations of the USTs at a depth of approximately 17 feet bgs (Figure 2). Ten soil samples were collected beneath the former locations of the fuel dispensers at depths ranging from 3 to 4 feet bgs. Three soil sampling were collected beneath the former locations of the piping at depths of approximately 3 to 5.5 feet bgs.

Benzene, ethylbenzene, xylenes, and oxygenate compounds were not detected in soil samples collected during the excavation activities. Toluene was detected in one soil sample collected beneath dispenser 5 (FD5-4) at a concentration of 0.003 milligrams per kilogram (mg/kg). Methyl tert-butyl ether (MTBE) was detected at concentration ranging from 0.014 to 0.071 mg/kg in soil samples collected beneath dispenser 5 (FD5-4) and the tank 1 excavation (T1A-17), respectively. Total petroleum hydrocarbons as gasoline (TPH-g) was detected in three soil samples at concentrations ranging from 1 to 305 mg/kg. Total petroleum hydrocarbons as diesel (TPH-d) was detected in six soil samples at concentrations ranging from 10 to 6,370 mg/kg.

Additional soil was excavated following review of the laboratory results on August 27, 2003 (URS 2003). Soil was excavated in the vicinity of the former locations of dispensers 1 and 2, satellite dispensers 2 and 3, and UST T2. Soil samples collected at the time of the second excavation indicated additional soil was impacted by hydrocarbons.

On September 28, 2003, a third excavation was performed in the vicinity of the former locations of dispensers 1 and 2. Soil samples collected during the third excavation event did not contain detectable concentrations of benzene, toluene, ethylbenzene, or xylenes (BTEX). MTBE was detected in one soil sample collected beneath T2 at a concentration of 0.021 mg/kg. Another analysis was run to confirm the presence of MTBE, however, and results indicated no detectable concentrations of MTBE. The previous results were therefore not considered valid. TPH-g was detected in one soil sample collected from dispensers 1 and 2 at a concentration of 2.3 mg/kg. TPH-d was detected in soil samples at concentrations ranging from 11 to 481 mg/kg. In all, 47 tons of soil was excavated and transported off-site for disposal

Based on confirmation soil sampling, it was recommended that additional excavation would undermine the concrete slab adjacent to the fieldwork, and that no further excavation be necessary since residual concentrations were below preliminary remediation goals (PRGs) for industrial soil.

3. SCOPE OF WORK

The scope of this project is to advance and sample ten (10) boreholes using a sonic drill rig, characterize the site's soil for impact from the operation of a UST system..

4. HAZARD ASSESSMENT

The following chemical and physical hazard assessment applies only to the proposed tasks as described in Section 3.0.

4.1. Chemical Hazards

The following types of chemicals may be present as contaminants of concern during the proposed investigation at this facility.

- Petroleum hydrocarbons including gasoline associated with on-site and off-site USTs

4.1.1. Petroleum Hydrocarbons

The predominant contaminant found at the UST facilities is gasoline or possibly diesel fuel that is related to the former operation of the subject UST system. However, other petroleum products may have been dispensed or stored at these properties. The site may also be impacted from off-site sources of petroleum contamination such as leaking USTs.

4.1.1.1. Gasoline

Gasoline is a highly complex mixture of more than 150 aliphatic and aromatic hydrocarbons including small amounts of benzene, toluene, xylene, and sometimes either tetraethyl lead or methyl tertiary butyl ether. The actual composition varies with the source of the crude petroleum, the manufacturer, and the time of year.

Gasoline is a colorless, pale brown, or pink liquid. Gasoline is very flammable; it catches on fire quite easily, evaporates quickly, and forms explosive mixtures with air. Most people can begin to smell gasoline at 0.25 parts of gasoline per million parts of air (ppm). Gasoline may be present in the air, groundwater, and soil. Gasoline does not dissolve readily in water. However, some of the chemicals that make up gasoline can dissolve easily in water.

Exposure to the vapors of gasoline above its exposure limit may produce irritation of the mucous membranes of the upper respiratory tract, nose and mouth. Overexposure may also result in the depression of the central nervous system. Symptoms of such exposure include drowsiness, headache, fatigue and drunken-like behaviors. Another common effect is irritation of the skin and mucous membranes of the upper respiratory tract. Repeated or prolonged skin contact may result in dermatitis due to defatting of the skin.

The American Conference of Governmental Industrial Hygienists (ACGIH) has recommended a threshold limit value (TLV) of 300 ppm for gasoline as an 8-hour time weighted average (TWA).

Tetraethyl and tetramethyl lead were used as anti-knock ingredients in gasoline. There is a potential at this site for these alkyl-lead compounds to be present. Due to its relatively low volatility (VP = 0.2 mm), exposure to tetraethyl lead is not likely to occur by the vapor route during this work, rather as a contaminant of airborne dust. The inhalation of tetraethyl lead contaminated dusts may result in irritation of the respiratory tract. This dust, when in contact with moist skin or eye membranes, may cause itching, burning and transient redness. The direct absorption of a sufficient quantity of tetraethyl lead, whether briefly at a high rate, or for prolonged periods at a low rate, may cause acute intoxication of the central nervous system. Mild degrees of intoxication may cause headache, anxiety, insomnia, nervous excitation and minor gastrointestinal disturbances. The OSHA PEL for both compounds is 0.075 mg/m^3, as an 8-hr TWA.

Methyl tertiary butyl ether (MTBE) is an additive used to increase the octane ratings of gasoline. Direct contact with the liquid may cause minor skin and eye irritation. Prolonged or repeated inhalation of MTBE vapor may cause irritation of the respiratory tract as well as depression of the central nervous system. OSHA has not established a PEL for MTBE. However, the ACGIH recommends a TLV of 50 ppm, as an 8-hr TWA.

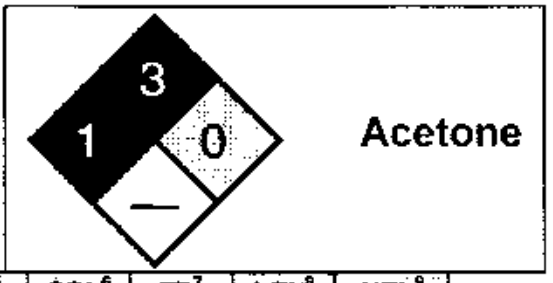
4.1.1.2. Fuel Oils (Diesel, etc.)

Fuel oils are generally considered to be of moderate to low toxicity. Federal or recommended airborne exposure limits have not been established for the vapors of fuel oils. However, inhalation of low concentrations of the vapor of either may cause mucous membrane irritation. Inhalation of high concentrations of the vapors may cause extensive pulmonary edema. Chronic direct skin contact with the liquids may produce skin irritation as a result of defatting. Repeated skin contact may also cause irritation of the hair follicles and block the sebaceous glands. This produces a rash of acne pimples and spots, usually on the arms and legs.

4.1.1.3. Waste Oils

Waste oils are generally considered to be of moderate to low toxicity. Federal or recommended airborne exposure limits have not been established for the vapors of waste oils. However, inhalation of low concentrations of the vapor of either may cause mucous membrane irritation. Inhalation of high concentrations of the vapors may cause extensive pulmonary edema. Chronic direct skin contact with the liquids may produce skin irritation as a result of defatting. Waste oils typically contain low concentrations of polycyclic aromatic hydrocarbons (PAH) compounds (incomplete combustion byproducts) and metals (contact with metal parts of the engine). Dermal contact with both PAH compounds and metals can result in dermatitis.

4.1.2. Hazardous Properties of Potential Chemical Contaminants



Chemical Name	PEL[1]	TLV[2]	VP[3]	VD[4]	SG[5]	SOL[6]	FP[7]	LEL[8]	UEL[9]
Gasoline	NE	300	>400	3	0.8	Neg.	<-40	1.4	7.6
Benzene	1	0.5	75	2.8	0.88	0.07	12	1.2	7.8
Toluene	200	50	21	3.1	0.87	0.07	40	1.1	7.1
Ethylbenzene	100	100	7	3.7	0.87	0.01	55	0.8	6.7
Xylene	100	100	7	3.7	0.88	0.02	90	0.9	6.7
Tetraethyl lead	0.075 mg/M^3	0.1 mg/m^3	0.2	8.6	1.6	Neg.	200	1.8	?
MTBE	NE	50	245	3.0	0.74	2	-15	1.5	?
Diesel Fuel Oil	NE	NE	0.5	>2	0.85	Neg.	>52	0.6	7.0

1 Permissible Exposure Limit in ppm
2 Threshold Limit Value in ppm
3 Vapor Pressure in mm Hg
4 Vapor Density (air = 1)
5 Specific Gravity (water = 1)
6 Solubility in Water in %
7 Flash Point in °F
8 Lower Explosive Limit in % by volume
9 Upper Explosive Limit in % by volume
NE = Not Established
NA = Not Applicable
? = Not known

4.1.3. Hazardous Substances Brought On-Site by ENSR

A material safety data sheet (MSDS) must be available for each hazardous substance that ENSR brings onto the property. This includes solutions/chemicals that will be used to decontaminate sampling equipment, field test kits, calibration gases or dye solutions. As a minimum, the MSDS for isobutylene calibration gas (for the PID) is provided in Attachment D. Other MSDSs should be attached as required, and may include:

- Alconox,
- Alcohols
- Gasoline

In addition, all containers of hazardous materials must be labeled in accordance with OSHA's Hazard Communication Standard. Either the original manufacturer's label or an NFPA 704M label specific for the material (as shown at the right) is considered to be an acceptable label.

4.2. Hazard Potential / Control

4.2.1. Hazard Potential

The potential routes of exposure based on the proposed activities include:

- Dermal contact with potentially contaminated groundwater during sampling activities;
- Dermal contact with separate phase product, agricultural chemicals, if present;
- Inhalation of petroleum vapors during sampling activities, especially if free-phase product is encountered or USTs on site are known to have leaked; and,

4.2.2. Hazard Control

Hazards can be identified and controlled in several ways.

- To reduce the potential for contact with contaminated groundwater, as well as separate phase product, personal protective equipment (PPE), as described in Section 7.1 of this HASP, will be worn.

5. PHYSICAL HAZARDS

5.1. Traffic Hazards

5.1.1. ENSR Employees

Incoming and outgoing traffic in the parking areas and dispensing islands will be a concern to the field teams. When working in these high traffic areas, the following precautions should be implemented.

- Wear an orange safety vest. If work is being performed at dawn, dusk or evening the vests must have reflective tape.

- Set up traffic cones or "Men at Work" signs in front of the work area.

At certain sites, remediation activities may occur along or in a public roadway or right-of-way. The PM must contact the local police department to determine if a police detail is required.

5.1.2. Patrons, Residents, General Public

The facilities may be open to the public while investigations are taking place. A restricted zone will be established around those areas where remediation is occurring. The purpose of this restricted zone is to warn patrons of the potential physical hazards associated with the activities being performed or supervised by ENSR. If space permits, a 20-foot radius restricted zone will be established around the work area. The restricted zone should be outlined with traffic cones or "Caution Tape" to prohibit entry by the general public.

5.2. Noise

Pumps, generators, and other equipment used during sampling events can produce high noise levels. Exposure to noise can result in the following:

- Temporary hearing losses where normal hearing returns after a rest period;
- Interference with speech communication and the perception of auditory signals;
- Interference with the performance of complicated tasks; and,
- Permanent hearing loss due to repeated exposure resulting in nerve destruction in the hearing organ.

Since personal noise monitoring will not be conducted during the proposed activities, employees must follow this general rule of thumb:

If the noise levels are so loud that you must shout at someone who is 5 feet away from you, you need to be wearing hearing protection. ENSR employees can wear either disposable earplugs or earmuffs but all hearing protection must have a minimum noise reduction rating (NRR) of 27 db.

5.3. Back Safety / Lifting

Using the proper techniques to lift and move heavy pieces of equipment, such as large-diameter piping, generators or drums, is important to reduce the potential for back injury. The following precautions should be implemented when lifting or moving heavy objects.

- Use mechanical devices to move objects, such as drums of investigation derived wastes or generators, that are too heavy to be moved manually
- If mechanical devices are not available, ask another person to assist you.
- Bend at the knees, not the waist. Let your legs do the lifting.
- Do not twist while lifting
- Bring the load as close to you as possible before lifting
- Be sure the path you are taking while carrying a heavy object is free of obstructions and slip, trip and fall hazards

5.4. Electrical Hazards

Electrically operated pumps and other equipment may present the hazard of electrical shock, especially due to potentially wet operating environments. Also, portable electrical tools can present the same hazard. Follow the safety precautions listed below:

- Check to see that electrical outlets used to supply power are of the three wire grounding type.
- Extension cords should be of the three wire grounding type and designed for hard or extra-hard usage. This type of cord uses insulated wires within an inner insulated sleeve and will be marked S, ST, STO, SJ, SJO or SJTO.
- NEVER remove the ground plug blade to accommodate ungrounded outlets.
- Do not use extension cords as a substitute for fixed or permanent wiring. Do not run extension cords through openings in walls, ceilings or floors, or permanently attach to walls with staples, nails, etc.
- Protect cords from becoming damaged.
- Examine extension and equipment cords and plugs prior to each use. Damaged cords with frayed insulation or exposed wiring and damaged plugs with missing ground blades MUST BE REMOVED from service immediately.
- All 15 and 20 amp portable or temporary wiring which is used outdoors or in other potentially wet or damp locations must be connected to a circuit which is protected by a ground fault

circuit interrupter (GFCI). GFCI's are available as permanently installed outlets, as plug-in adapters and as extension cord outlet boxes. DO NOT CONTINUE TO USE A PIECE OF EQUIPMENT OR EXTENSION CORD THAT CAUSES A GFCI TO TRIP.

- When working in flammable atmospheres, be sure that the electrical equipment being used is approved for use in Class I, Division I atmospheres.
- Do not touch a victim who is still in contact with current. Separate the victim from the source using a dry, nonmetallic item such as a broomstick or cardboard box. Be sure your hands are dry and you are standing on a dry surface. Turn off the main electrical power switch and then begin rescue efforts.

5.5. Thermal Stress

O&M activities may be performed during any month of the year. The hazards associated with heat and cold stress are addressed below:

5.5.1. Heat Stress

Types of Heat Stress

Heat related problems include **heat rash, fainting, heat cramps, heat exhaustion and heat stroke**. **Heat rash** can occur when sweat isn't allowed to evaporate, leaving the skin wet most of the time and making it subject to irritation. **Fainting** may occur when blood pools to lower parts of the body and as a result, does not return to the heart to be pumped to the brain. Heat related fainting often occurs during activities that require standing erect and immobile in the heat for long periods of time. **Heat cramps** are painful spasms of the muscles due to excessive salt loss associated with profuse sweating. **Heat exhaustion** results from the loss of large amounts of fluid and excessive loss of salt from profuse sweating. The skin will be clammy and moist and the affected individual may exhibit giddiness, nausea and headache. **Heat stroke** occurs when the body's temperature regulatory system has failed. The skin is hot, dry, red and spotted. The affected person may be mentally confused and delirious. Convulsions could occur. EARLY RECOGNITION AND TREATMENT OF HEAT STROKE ARE THE ONLY MEANS OF PREVENTING BRAIN DAMAGE OR DEATH. A person exhibiting signs of heat stroke should be removed from the work area to a shaded area. The person should be soaked with water to promote evaporation. Fan the person's body to increase cooling. Increased body temperature and physical discomfort also promote irritability and a decreased attention to the performance of hazardous tasks.

Early Symptoms of Heat-Related Health Problems:

- Decline in task performance
- Reduced vigilance

- incoordination
- decline in alertness
- unsteady walk
- excessive fatigue
- muscle cramps
- dizziness

Susceptibility to Heat Stress Increases due to:

- lack of physical fitness
- lack of acclimation
- increased age
- dehydration
- obesity
- drug or alcohol use
- sunburn
- infection

People unaccustomed to heat are particularly susceptible to heat fatigue. First timers in PPE need to gradually adjust to the heat.

The Effect of Personal Protective Equipment

Sweating normally cools the body as moisture is removed from the skin by evaporation. However, the wearing of certain personal protective equipment (PPE), particularly chemical protective coveralls (e.g., Tyvek), reduces the body's ability to evaporate sweat and thereby regulate heat buildup. The body's efforts to maintain an acceptable temperature can therefore become significantly impaired by the wearing of PPE.

Measures to Avoid Heat Stress:

The following guidelines should be adhered to when working in hot environments:

- Establish work-rest cycles (short and frequent are more beneficial than long and seldom).
- Identify a shaded, cool rest area.
- Rotate personnel, alternative job functions.
- Water intake should be equal to the sweat produced. Most workers exposed to hot conditions drink less fluid than needed because of an insufficient thirst. DO NOT DEPEND ON THIRST TO SIGNAL WHEN AND HOW MUCH TO DRINK. For an 8-hour workday, 50 ounces of fluids should be drunk.
- Eat lightly salted foods or drink salted drinks such as Gatorade to replace lost salt.
- Save most strenuous tasks for non-peak heat hours such as the early morning or at night.
- Avoid alcohol during prolonged periods of heat. Alcohol will cause additional dehydration.
- Avoid double shifts and/or overtime.

The implementation and enforcement of the above mentioned measures would be the joint responsibility of the project manager, on-site field coordinator, and health and safety officer. Potable water and fruit juices should be made available each day for the field team.

Heat Stress Monitoring Techniques

Site personnel should regularly monitor their heart rate as an indicator of heat strain by the following method:

> Check radial pulse rates by using fore-and middle fingers and applying light pressure to the pulse in the wrist for one minute at the beginning of each rest cycle. If the pulse rate exceeds 110 beat/minute, shorten the next work cycle by one-third and keep the rest period the same. If, after the next rest period, the pulse rate still exceeds 110 beats/minute, shorten the work cycle again by one-third.

5.6. Insects etc.

Insect repellants containing DEET as a main ingredient are most effective against mosquitoes and other insects. DEET can be directly applied to the exposed skin of adults and/or clothing. Permanone® is another repellent however, it can only be directly applied to clothing.

5.7. Drilling Hazards

5.7.1. Conventional Drilling

Use of a hollow stem augur or sonic drill rig to advance soil borings and install monitoring wells will require all personnel in the vicinity of the operating rig to wear steel-toed boots, hardhats, hearing protection and safety eyewear. Personnel shall not remain in the vicinity of operating equipment unless it is required for their work responsibilities. Additionally, the following safety requirements must be adhered to:

- All drill rigs and other machinery with exposed moving parts must be equipped with an operational emergency stop device. Drillers and geologists must be aware of the location of this device. This device must be tested prior to job initiation and periodically thereafter. The driller and helper shall not simultaneously handle augers unless there is a standby person to activate the emergency stop.
- The driller must never leave the controls while the rig is running unless all personnel are kept clear of rotating equipment.
- A long-handled shovel or equivalent must be used to clear drill cuttings away from the hole and from rotating tools. Hands and/or feet are not to be used for this purpose.

- A remote sampling device must be used to sample drill cuttings if the tools are rotating or if the tools are readily capable of rotating. Samplers must not reach into or near the rotating equipment. If personnel must work near any tools which could rotate, the driller must shut down the rig prior to initiating such work.
- Drillers, helpers and geologists must secure all loose clothing when in the vicinity of drilling operations.
- Only equipment which has been approved by the manufacturer may be used in conjunction with site equipment and specifically to attach sections of drilling tools together. Pins that protrude excessively from augers shall not be allowed
- No person shall climb the drill mast while tools are rotating.
- No person shall climb the drill mast without the use of ANSI-approved fall protection (approved belts, lanyards and a fall protection slide rail) or portable ladder which meets the requirements of OSHA standards.

6. AIR MONITORING

During routine O&M or sampling at remediation sites, air monitoring is not expected to be necessary. However, for sites having high concentrations of contaminant, or during certain maintenance or sampling activities in which the system is open to the atmosphere, the following instruments may be necessary to verify no exposures or explosion hazards:

6.1. Direct Reading Instrumentation

Instrument I: Photoionization detector (PID)

A PID, such as a RaeSystems MiniRae 2000 ™ equipped with a 10.6 ev lamp, should be used to screen the breathing zone of O&M employees during potential chemical exposures (working with open remediation systems, filter changes, repair of monitoring wells, and sampling activities. If breathing zone concentrations are sustained (15 minutes) at 75 PID units, Level C respiratory protection, as described in Section 7.2, will be donned. This action level is based on the PEL of hexane, and upon 1/6 of the PEL for gasoline, and is designed to protect against the most toxic component of gasoline (benzene), as reported in vapor studies. This action level is also adequate to protect employees from exposure to the vapors of chlorinated solvents, unless vinyl chloride and DCE are present, in which case specific detector tubes are required.

A PID, such as a RaeSystems MiniRae 2000 ™ equipped with a 10.6 eV lamp and calibrated to isobutylene, be used to screen the breathing zone of O&M employees during potential chemical exposures (working with open remediation systems, filter changes, repair of monitoring wells, and sampling activities If breathing zone concentrations are sustained (15 minutes) at 50 units above background, Level C respiratory protection, as described in Section 7.2, will be donned.

This 50 unit Action Limit is based on the following:

- The current TLV for gasoline is 300 ppm. The most toxic component of gasoline is benzene, whose current TLV is 0.5 ppm. Studies done by McDermott and Killiany in 1978 (Quest for a Gasoline TLV – AIHAJ 39:110-117, 1978) indicate that the benzene content of gasoline vapor is typically in the range of 0.4%. To assure that employee exposures to benzene remain below the current TLV of 0.5 ppm, ENSR has established an Action Limit of 50 ppm total VOCs (i.e., approximately 0.5 ppm/0.4%) for gasoline contaminated sites. Based upon RaeSystems response data for gasoline on an isobutylene calibrated instrument (i.e., 1.0), this equates to an instrument reading of 50 units. This action level is also more than adequate to protect employees from exposure to the vapors of chlorinated solvents that may be on site due to former on-site auto repair activities or off-site sources of contamination (unless vinyl chloride and DCE are present, in which case specific detector tubes are required).

Instrument II: Combustible Gas Monitor (CGI, or LEL Meter)

If high levels of contamination (plume, etc.) are associated with the site, or if high PID readings are encountered (~1000 PID units), a CGI must be used to quantify the reading for explosive gases or vapors. The action level for stopping work is 10% LEL.

6.2. Personal Exposure Monitoring

Personal exposure monitoring will not be conducted.

6.3. Calibration and Recordkeeping

The PID (and the CGI, if used) will be calibrated on a daily basis in accordance with ENSR's Standard Operating Procedure and manufacturer's instructions. All PID readings will be recorded in the field notebook or on dedicated air monitoring result sheets. In addition, all calibrations must be recorded.

7. PERSONAL PROTECTIVE EQUIPMENT

7.1. Protective Clothing

To prevent direct dermal contact with potentially contaminated soil and/or groundwater, the following protective clothing requirements will be followed:

PPE Item	General	Sampling
Hard hat	1	√
Safety glasses	1	√
Faceshield		5
Steel-toed boots	1	
Gloves, Inner PVC		√
Gloves, Outer Nitrile		√
Traffic Vest	√	√

1. According to client rules for the site.
2. Wear work gloves when handling pipe or sharp-edged equipment; impervious gloves for chemical exposure.
3. Wear hearing protection in areas where noise levels exceed 85 dBA (or speech becomes difficult)
4. Lockout/Tagout is required when working on energized equipment.
5. Goggles or a face shield are required where contaminant may be splashed or is under pressure.

7.2. Respiratory Protection

Although respiratory protection is not expected to be needed during most O&M activities, air monitoring should be performed when working with high contamination, open systems, or elsewhere if exposure may be likely. If the Action Limit of 50 PID units is exceeded for more than a 15-minute period within the breathing zone of employees, Level C respiratory protection will be required.

Task	Action Limit	Respiratory Protection
When working with high contamination, open systems, or elsewhere if exposure may be likely	50 units above background on the PID for sustained 15 minute period.	Half mask air purifying respirator with combination organic vapor/HEPA cartridges

Respiratory protection should also be donned if:

- Odors become objectionable at any time or
- Respiratory tract irritation is noticed.

All employees who are expected to wear respiratory protection must have successfully passed a quantitative or qualitative fit-test within the past year.

Level C offers no protection against the hazards associated with exposure to carbon monoxide. If heating or other sources of combustion are used within a building, a carbon monoxide meter must be used to monitor the build up of exhaust gas in the building. The unit will be set to alarm at 25 ppm. If the alarm sounds, work will cease and all employees will leave the building. If carbon monoxide concentrations can not be reduced, mechanical ventilation will be required.

7.3. Other Safety Equipment

The following additional safety equipment will be brought to the site:

- Portable eye wash
- First Aid Kit
- Type A-B-C fire extinguisher
- Portable phone

8. SITE CONTROL

To prevent both exposure to unprotected personnel and migration of contamination due to tracking by personnel or equipment, work areas along with personal protective equipment requirements will be clearly defined.

8.1. Designation of Zones

- Exclusion or "hot" Zone
- Contamination Reduction Zone (CRZ)
- Support Zone

8.2. Exclusion Zone

Some service stations will be open to the public while O&M activities are taking place. A restricted zone will be established around those work areas where samples are being collected and processed. The purpose of this restricted zone is to warn patrons of the potential hazards associated with the activities being performed by ENSR. If space permits, a 10-foot radius restricted zone will be established around the work area. Temporarily restricted zones should be outlined with traffic cones or "Caution Tape" to prohibit entry by the general public, however, long-term remediation operations should be protected in a more permanent manner from public access.

Similarly, restricted zones should be established around sampling and other work areas so that motorists can easily identify the presence of ENSR personnel on the property.

8.3. Contamination Reduction Zone

Contamination reduction facilities will be established immediately adjacent to any area in which workers may be exposed to toxic material. This is where personnel will begin the sequential decontamination process (see Section 9.0) when exiting the exclusion zone. To prevent cross contamination and for accountability purposes, all personnel will enter and leave the exclusion zone through the contamination reduction zone.

8.4. Support Zone

The support zone will consist of those areas around the exclusion zone where equipment is staged. Eating, drinking and smoking will be limited to this area.

8.5. Safety Measures/Precautions

The following measures are designed to augment the specific health and safety guidelines provided in this plan.

- ENSR personnel should avoid working alone on remote sites. On most sites, client, subcontractor, or public personnel are generally nearby in case of an emergency or accident. ENSR personnel, through coordination, can rely upon these personnel for assistance in an emergency. If no one else is nearby, scheduled call-in's on a cell phone may be used to assure personal safety.
- Avoidance of contamination is of the utmost importance. Whenever possible, avoid contact with contaminated (or potentially contaminated) surfaces or materials. Walk around (not through) puddles and discolored surfaces. Do not kneel on the ground or set equipment on the ground. Protect air monitoring equipment from water by bagging.
- Eating, drinking, chewing gum or tobacco, smoking or any practice that increases the probability of hand-to-mouth transfer and ingestion of materials is prohibited in the immediate work area and the decontamination zone.
- Hands and face must be thoroughly washed upon leaving the work area and before eating, drinking or any other activities.
- Beards or other facial hair that interfere with respirator fit are prohibited.
- The use of alcohol or illicit drugs is prohibited during the conduct of field operations.
- All equipment must be decontaminated or properly discarded before leaving the site in accordance with the project work plan.
- Safety equipment described in Section 6 and 7 will be required for all field personnel unless otherwise approved by the RHSM.

9. DECONTAMINATION

Proper decontamination is required of all personnel before leaving the site. The extent of personnel decontamination will depend on the amount of contamination encountered. Personnel decontamination will be accomplished by following a systematic procedure of cleaning (when necessary) and removing personal protective clothing (PPE). If necessary, contaminated PPE such as boots will be rinsed free of gross contamination, scrubbed clean in a detergent solution and then rinsed clean. To facilitate this, it may be necessary to establish a three basin wash system on site.

Disposable PPE, such as gloves, will be disposed of in accordance with the work plan and the client's requirements.

Regardless of the type of decontamination system required, if washing facilities are unavailable, a container of potable water and liquid soap must be made available so employees can wash their hands and face before leaving the site for lunch or for the day.

10. MEDICAL / TRAINING REQUIREMENTS

10.1. Medical Surveillance

All personnel performing activities covered by this HASP must be active participants in a medical monitoring program that complies with 29 CFR 1910.120 (f). Each individual must have completed an annual surveillance examination and/or an initial baseline examination within the last year prior to performing any work on this site covered by this HASP.

10.2. Training

All personnel performing activities covered by this HASP must have completed the appropriate training requirements specified in 29 CFR 1910.120 (e). Each individual must have completed an annual 8-hour refresher training course and/or initial 40-hour training course within the last year prior to performing any work on this site covered by this HASP.

In addition, each project location must have at least one staff member present on site at all times who is currently trained in First Aid and CPR (Cardio Pulmonary Resuscitation).

10.3. Site Safety Meetings

Prior to the commencement of investigative activities at each project location, a site safety meeting will be conducted by the SSO to review the specific requirements of this HASP. Attendance at this pre-entry briefing is mandatory and will be documented (see Attachment B). Short safety refresher meetings will be conducted at least every 10 days thereafter, or as otherwise needed, throughout the duration of the project.

11. AUDITS AND INSPECTIONS

Safety audits must be conducted and documented for each project location on a monthly basis. In order to meet this requirement, typically these inspections will have to be conducted by the ENSR field team leader and/or project manager.

For short duration jobs (i.e., one week or less), the safety inspection should be conducted shortly after the work has commenced. For longer duration jobs, the inspection should be conducted shortly after commencement and monthly thereafter.

Audits should be documented on the ENSR PM Audit Checklist. To reduce the overall length of this HASP, a copy of the audit checklist is embedded below. Access the checklist by clicking on the icon below. ENSR PMs should print out a copy of the checklist before leaving for the job site, unless a computer and printer will be available at the site.

"Audit Inspection Checklist.xls"

12. INCIDENT RESPONSE

12.1. Emergencies

OSHA defines emergency response as any "response effort by employees from outside the immediate release area or by other designated responders (i.e., mutual-aid groups, local fire departments, etc.) to an occurrence that results, or is likely to result in an uncontrolled release of a hazardous substance." According to ENSR policy, ENSR personnel shall not participate in any emergency response where there are potential safety or health hazards (i.e., fire, explosion, or chemical exposure). ENSR response actions will be limited to evacuation and medical/first aid as described within this section below. As such, this section of the HASP has been written to comply with 29 CFR 1910.38 (a).

The basic elements of an emergency evacuation plan include employee training, alarm systems, escape routes, escape procedures, critical operations or equipment, rescue and medical duty assignments, designation of responsible parties, emergency reporting procedures and methods to account for all employees after evacuation.

Employee Training: Employees must be instructed in the specific aspects of emergency evacuation applicable to the site as part of the pre-entry briefing prior to the commencement of all on-site activities. On-site refresher or update training is required anytime escape routes or procedures are modified or personnel assignments are changed.

Alarm Systems/Emergency Signals: An emergency communication system must be in effect at all sites. The most simple and effective emergency communication system in many situations will be **direct verbal communications**.

Due to the small size of the sites direct communications will be sufficient to warn all employees of a site-related emergency. Although most of the facilities are occupied, some of the facilities are abandoned. ENSR should bring cellular phones to every unoccupied facility with them to summons emergency responders, if necessary.

Escape Routes and Procedures: The escape route from the work location will be verified by the SSO upon arrival to the site. The route will be reviewed with all employees during the pre-entry briefing.

Critical Operations and Equipment: All equipment and operations are required to cease in the event of site evacuation. The only exception will be related to health and safety. The PM or SSO must determine at the time of an emergency if health and safety will be jeopardized by immediate stoppage of any particular piece of equipment or personal activities. If such a

determination is made, personnel involved in critical duties must be minimized and special instructions must be established.

Rescue and Medical Duty Assignments: Prior to initiating work at the site, an ENSR field team member, usually the SSO, shall be appointed to activate emergency response actions. In the event an injury or illness requires more than first aid treatment, that individual will accompany the injured person to the medical facility and will remain with the person until release or admittance is determined. The escort will relay all appropriate medical information to the on-site project manager and the RHSM.

If the injured employee can be moved from the accident area, he or she will be brought to the CRZ where their PPE will be removed. If the person is suffering from a back or neck injury the person will not be moved and the requirements for decontamination do not apply. The SSO must familiarize the responding emergency personnel about the nature of the site and the injury. If the responder feels that the PPE can be cut away from the injured person's body, this will be done on-site. If this not feasible, decontamination will be performed after the injured person has been stabilized.

Designation of Responsible Parties: The SSO is responsible for initiating emergency response. In the event the SSO can not fulfill this duty, the alternate SSO will take charge. All personnel onsite are responsible for knowing the escape route from the site.

Employee Accounting Method: The on-site project manager or SSO is responsible for identifying all ENSR personnel on-site at all times. On small, short duration jobs this can be done informally as long as accurate accounting, via a head-count, is possible.

12.2. Incident Reporting/Investigation

12.2.1. ENSR Requirements

All work-related injuries and illnesses, regardless of severity, must be reported to the ENSR field team leader and/or project manager immediately. The field team leader and/or project manager must report the incident to the ENSR RHSM as soon as possible. Utilize the RHSMs voice mail or e-mail if the incident occurs after hours.

In addition, all near miss incidents must be reported to the ENSR RHSM as soon as possible.

An ENSR Supervisor's Accident Investigation Report form (Attachment C) must be completed by the ENSR field team leader and/or project manager in accordance with the instructions provided by the RHSM and submitted to the RHSM within 24 hours of occurrence of the incident.

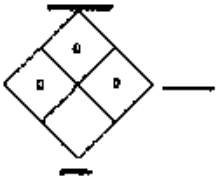
Material Safety Data Sheets

Airgas

MATERIAL SAFETY DATA SHEET

Prepared to U.S. OSHA, CMA, ANSI and Canadian WHMIS Standards

NFPA RATING



PART I *What is the material and what do I need to know in an emergency?*

1. PRODUCT IDENTIFICATION

CHEMICAL NAME/ CLASS:	**NON-FLAMMABLE GAS MIXTURE**
	Document Number: 002103
PRODUCT USE:	For general analytical/synthetic chemical uses.
SUPPLIER/MANUFACTURER'S NAME:	AIRGAS INC.
ADDRESS:	259 North Radnor-Chester Road
	Suite 100
	Radnor, PA 19087-5283
BUSINESS PHONE:	1-610-687-5253
EMERGENCY PHONE:	1-800-949-7937
	International: 1-423-479-0293
DATE OF PREPARATION:	April 22, 2001

2. COMPOSITION and INFORMATION ON INGREDIENTS

CHEMICAL NAME	CAS #	mole %	EXPOSURE LIMITS IN AIR					
			ACGIH		OSHA		NIOSH	OTHER
			TLV ppm	STEL ppm	PEL ppm	STEL ppm	IDLH ppm	ppm
Isobutylene	115-11-7	1 ppm - 1.7%	There are no specific exposure limits for Isobutylene. Isobutylene is a simple asphyxiant (SA). Oxygen levels should be maintained above 19.5%.					
Air	25635-88-5	Balance	There are no specific exposure limits applicable to Air.					
Air is a mixture of gases. The primary components of air, and the approximate concentration of each component, are listed below.								
Nitrogen	7727-37-9	79%	There are no specific exposure limits for Nitrogen. Nitrogen is a simple asphyxiant (SA). Oxygen levels should be maintained above 19.5%.					
Oxygen	7782-44-7	21%	There are no specific exposure limits for Oxygen.					

NE = Not Established. See Section 16 for Definitions of Terms Used

NOTE (1): ALL WHMIS required information is included in appropriate sections based on the ANSI Z400.1-1998 format. This product has been classified in accordance with the hazard criteria of the CPR and the MSDS contains all the information required by the CPR.

3. HAZARD IDENTIFICATION

EMERGENCY OVERVIEW: This product is a colorless, odorless, non-flammable gas. The main health hazards associated with releases of this gas are related to the high pressure within the cylinder. Air, the main component of this product, is generally considered non-flammable, however, Air will support combustion. The flammable component of this gas mixture is below the LEL. A cylinder rupture hazard exists when this product, which is under pressure, is subjected to heat or flames. Emergency responders must wear personal protective equipment appropriate for the situation to which they are responding.

3. HAZARD IDENTIFICATION (Continued)

SYMPTOMS OF OVER-EXPOSURE BY ROUTE OF EXPOSURE: The most significant route of over-exposure for *air* is by inhalation at elevated or reduced pressure.

INHALATION: This product is non-toxic. Air, the main component of this product, is necessary for life.

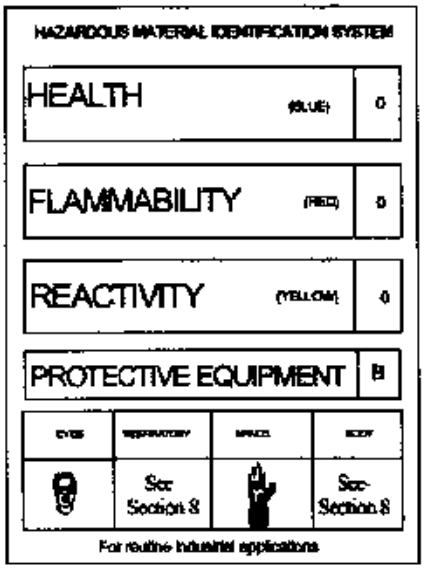
OTHER POTENTIAL HEALTH EFFECTS: Contact with rapidly expanding gases (which are released under high pressure) may cause frostbite. Symptoms of frostbite include change in skin color to white or grayish-yellow. The pain after contact with liquid can quickly subside.

HEALTH EFFECTS OR RISKS FROM EXPOSURE: An Explanation in Lay Terms. Over-exposure to this product may cause the following health effects:

ACUTE: The most significant hazards associated with compressed air is the pressure hazard. Contact with rapidly expanding gases (which are released under high pressure) may cause frostbite. Symptoms of frostbite include change in skin color to white or grayish-yellow. The pain after contact with liquid can quickly subside.

CHRONIC: There are currently no known adverse health effects associated with chronic exposure to this gas.

TARGET ORGANS: ACUTE: Respiratory system under ambient low pressure conditions. Central nervous system under ambient high pressure conditions. CHRONIC: None expected.



See Section 16 for Definition of Ratings

PART II *What should I do if a hazardous situation occurs?*

4. FIRST-AID MEASURES

RESCUERS SHOULD NOT ATTEMPT TO RETRIEVE VICTIMS OF EXPOSURE TO THIS PRODUCT WITHOUT ADEQUATE PERSONAL PROTECTIVE EQUIPMENT. At a minimum, Self-Contained Breathing Apparatus equipment should be worn.

Victim(s) must be taken for medical attention. Rescuers should be taken for medical attention, if necessary. Take copy of label and MSDS to physician or other health professional with victim(s). Remove victim(s) to fresh air, as quickly as possible. In case of eye contact which leads to irritation, immediately flush eyes with copious amounts of water for at least 15 minutes. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Only trained personnel should administer supplemental oxygen.

In case of frostbite, place the frostbitten part in warm water. DO NOT USE HOT WATER. If warm water is not available, or is impractical to use, wrap the affected parts gently in blankets. Alternatively, if the fingers or hands are frostbitten, place the affected area in the armpit. Encourage victim to gently exercise the affected part while being warmed. Seek immediate medical attention.

MEDICAL CONDITIONS AGGRAVATED BY EXPOSURE: Acute or chronic respiratory conditions, as well as disorders involving the "Target Organs", as listed in Section 3 (Hazard Information), may be aggravated by overexposure to the components of this product.

RECOMMENDATIONS TO PHYSICIANS: Administer oxygen as soon as possible, following exposure.

5. FIRE-FIGHTING MEASURES

FLASH POINT: Not applicable.
AUTOIGNITION TEMPERATURE: Not applicable.
FLAMMABLE LIMITS (in air by volume, %):
Lower (LEL): Not applicable.
Upper (UEL): Not applicable.

5. FIRE-FIGHTING MEASURES (Continued)

FIRE EXTINGUISHING MATERIALS: Non-flammable gas. Use extinguishing media appropriate for surrounding fire.

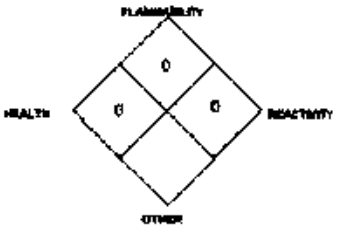
UNUSUAL FIRE AND EXPLOSION HAZARDS: When involved in a fire, this material may decompose and produce toxic gases including carbon monoxide and carbon dioxide. Additionally, when involved in fire, the cylinders may rupture.

Explosion Sensitivity to Mechanical Impact: Not Sensitive.

Explosion Sensitivity to Static Discharge: Not Sensitive.

SPECIAL FIRE-FIGHTING PROCEDURES: Structural fire-fighters must wear Self-Contained Breathing Apparatus and full protective equipment. Move fire-exposed cylinders from area, if it can be done without risk to fire-fighters. Withdraw immediately in case of rising sounds from venting pressure relief devices or any discoloration of tanks or cylinders due to a fire.

NFPA RATING



See Section 15 for Definition of Ratings

6. ACCIDENTAL RELEASE MEASURES

SPILL AND LEAK RESPONSE: Uncontrolled releases should be responded to by trained personnel using pre-planned procedures. Proper protective equipment should be used. In case of a release, clear the affected area, protect people, and respond with trained personnel. Minimum Personal Protective Equipment should be Level D: safety glasses, and mechanically-resistant gloves. Level B, which includes the use of Self-Contained Breathing Apparatus, should be worn when oxygen levels are below 19.5% or are unknown. Locate and seal the source of the leaking gas. If this does not stop the release (or if it is not possible to reach the valve), allow the gas to release in place or remove it to a safe area and allow the gas to be released there.

PART III *How can I prevent hazardous situations from occurring?*

7. HANDLING and STORAGE

WORK PRACTICES AND HYGIENE PRACTICES: Do not eat or drink while handling chemicals.

STORAGE AND HANDLING PRACTICES: Cylinders should be stored in dry, well-ventilated areas away from sources of heat. Compressed gases can present significant safety hazards. Store containers away from heavily trafficked areas and emergency exits.

SPECIAL PRECAUTIONS FOR HANDLING GAS CYLINDERS: Protect cylinders against physical damage. Store in cool, dry, well-ventilated, fireproof area, away from flammable or combustible materials and corrosive atmospheres. Store away from heat and ignition sources and out of direct sunlight. Do not store near elevators, corridors or loading docks. Do not allow area where cylinders are stored to exceed 52°C (125°F). Isolate from incompatible materials including flammable materials (see Section 10, Stability and Reactivity), which can burn violently. Use only storage containers and equipment (pipes, valves, fittings to relieve pressure, etc.) designed for the storage of Air. Do not store containers where they can come into contact with moisture. Cylinders should be stored upright and be firmly secured to prevent falling or being knocked over. Cylinders can be stored in the open, but in such cases, should be protected against extremes of weather and from the dampness of the ground to prevent rusting. Never tamper with pressure relief devices in valves and cylinders. The following rules are applicable to situations in which cylinders are being used:

Before Use: Move cylinders with a suitable hand-truck. Do not drag, slide or roll cylinders. Do not drop cylinders or permit them to strike each other. Secure cylinders firmly. Leave the valve protection cap in-place until cylinder is ready for use.

During Use: Use designated CGA fittings and other support equipment. Do not use adapters. Do not heat cylinder by any means to increase the discharge rate of the product from the cylinder. Use check valve or trap in discharge line to prevent hazardous backflow into the cylinder. Do not use oils or grease on gas-handling fittings or equipment.

After Use: Close main cylinder valve. Replace valve protection cap. Mark empty cylinders "EMPTY".

NOTE: Use only DOT or ASME code containers. Earth-ground and bond all lines and equipment associated with this product. Close valve after each use and when empty. Cylinders must not be recharged except by or with the consent of owner. For additional information refer to the Compressed Gas Association Pamphlet P-1, *Safe Handling of Compressed Gases in Containers*. Additionally, refer to CGA Bulletin SB-2 "*Oxygen Deficient Atmospheres*".

7. HANDLING and STORAGE (Continued)

PROTECTIVE PRACTICES DURING MAINTENANCE OF CONTAMINATED EQUIPMENT: Follow practices indicated in Section 6 (Accidental Release Measures). Make certain application equipment is locked and tagged-out safely. Purge gas handling equipment with inert gas (i.e. nitrogen) before attempting repairs. Always use product in areas where adequate ventilation is provided.

8. EXPOSURE CONTROLS - PERSONAL PROTECTION

VENTILATION AND ENGINEERING CONTROLS: Use with adequate ventilation.

RESPIRATORY PROTECTION: Maintain Oxygen levels above 19.5% in the workplace. If respiratory protection is needed, use only protection authorized in the U.S. Federal OSHA Standard (29 CFR 1910.134), applicable U.S. State regulations, or the Canadian CSA Standard Z94.4-93 and applicable standards of Canadian Provinces. Oxygen levels below 19.5% are considered IDLH by OSHA. In such atmospheres, use of a full-facepiece pressure/demand SCBA or a full facepiece, supplied air respirator with auxiliary self-contained air supply is required under OSHA's Respiratory Protection Standard (1910.134-1998).

EYE PROTECTION: Splash goggles, face-shields or safety glasses. If necessary, refer to U.S. OSHA 29 CFR 1910.133, or Canadian Standards.

HAND PROTECTION: Wear mechanically-resistant gloves when handling cylinders of this product. If necessary, refer to U.S. OSHA 29 CFR 1910.138 or appropriate Standards of Canada.

BODY PROTECTION: Use body protection appropriate for task. If a hazard of injury to the feet exists due to falling objects, rolling objects, where objects may pierce the soles of the feet or where employee's feet may be exposed to electrical hazards, use foot protection, as described in U.S. OSHA 29 CFR.

9. PHYSICAL and CHEMICAL PROPERTIES

The following information is for Air, the main component of this product, unless otherwise stated:

RELATIVE VAPOR DENSITY: 1	EVAPORATION RATE (nBuAc = 1): Not applicable.
SPECIFIC GRAVITY: Not applicable.	FREEZING POINT: -216.2°C (-357.2°F)
SOLUBILITY IN WATER: 1.48% (v/v)	BOILING POINT @ 1 atmos: -194.3°C(-317.8°F)
VAPOR PRESSURE, mmHg @ 20°C: Gas, ambient.	pH: Not applicable.
EXPANSION RATIO: Not applicable.	VAPOR PRESSURE: Not applicable.
SPECIFIC VOLUME: 13.3 ft³/lb; (0.833 m³/kg)	ODOR THRESHOLD: Not applicable.

COEFFICIENT WATER/OIL DISTRIBUTION: Not applicable

The following information is pertinent to this gas mixture:

APPEARANCE, ODOR AND COLOR: This product is a colorless, odorless gas.

HOW TO DETECT THIS SUBSTANCE (warning properties): There are no distinctive properties to this product. In terms of leak detection, fittings and joints can be painted with a soap solution to detect leaks, which will be indicated by a bubble formation.

10. STABILITY and REACTIVITY

STABILITY: Normally stable.

DECOMPOSITION PRODUCTS: None known.

MATERIALS WITH WHICH SUBSTANCE IS INCOMPATIBLE: Air (the main component of this product) is not compatible with fuels, in that air will support combustion. The isobutylene component of this mixture is incompatible with Strong oxidizers (e.g., chlorine, bromine pentafluoride, oxygen, oxygen difluoride, and nitrogen trifluoride).

HAZARDOUS POLYMERIZATION: Will not occur.

CONDITIONS TO AVOID: Contact with incompatible materials and exposure to heat, sparks and other sources of ignition. Cylinders exposed to high temperatures or direct flame can rupture or burst.

PART III *How can I prevent hazardous situations from occurring?*

11. TOXICOLOGICAL INFORMATION

TOXICITY DATA: The following toxicology data are for the components of this gas mixture present at a level greater than 1 mole %:

ISOBUTYLENE:
LC_{Lo} (Inhalation-Rat) 620 gm/m³/4 hours

ISOBUTYLENE (continued):
LC_{Lo} (Inhalation-Mouse) 415 gm/m³/2 hours

SUSPECTED CANCER AGENT: No component of this gas mixture is found on the following lists: FEDERAL OSHA Z LIST, NTP, CALIOSHA, IARC, and therefore is not considered to be, nor suspected to be, cancer-causing agents by these agencies.

11. TOXICOLOGICAL INFORMATION (Continued)

IRRITANCY OF PRODUCT: Contact with rapidly expanding gases can cause frostbite and damage to exposed skin and eyes.

SENSITIZATION OF PRODUCT: No component of this product is a skin or respiratory sensitizer.

REPRODUCTIVE TOXICITY INFORMATION: Listed below is information concerning the effects of this product and its components on the human reproductive system.

Mutagenicity: This product is not reported to cause mutagenic effects in humans.
Embryotoxicity: This product is not reported to cause embryotoxic effects in humans.
Teratogenicity: This product is not reported to cause teratogenic effects in humans.
Reproductive Toxicity: This product is not reported to cause adverse reproductive effects in humans.

A mutagen is a chemical which causes permanent changes to genetic material (DNA) such that the changes will propagate through generation lines. An embryotoxin is a chemical which causes damage to a developing embryo (i.e. within the first eight weeks of pregnancy in humans), but the damage does not propagate across generational lines. A teratogen is a chemical which causes damage to a developing fetus, but the damage does not propagate across generational lines. A reproductive toxin is any substance which interferes in any way with the reproductive process.

BIOLOGICAL EXPOSURE INDICES: Biological Exposure Indices (BEIs) have been determined for the components of this product are as follows:

12. ECOLOGICAL INFORMATION

ENVIRONMENTAL STABILITY: This gas will be dissipated rapidly in well-ventilated areas.

EFFECT OF MATERIAL ON PLANTS or ANIMALS: No adverse effect is anticipated to occur to plant life, except for frost produced in the presence of rapidly expanding gases.

EFFECT OF CHEMICAL ON AQUATIC LIFE: No evidence of an adverse effect of this product on aquatic life is currently available.

13. DISPOSAL CONSIDERATIONS

PREPARING WASTES FOR DISPOSAL: Product removed from cylinder must be disposed of in accordance with appropriate U.S. Federal, State and local regulations or with regulations of Canada and its Provinces. Return cylinders with residual product to Airgas, Inc. Do not dispose of locally.

14. TRANSPORTATION INFORMATION

THIS GAS MIXTURE IS HAZARDOUS AS DEFINED BY 49 CFR 172.101 BY THE U.S. DEPARTMENT OF TRANSPORTATION.

PROPER SHIPPING NAME:	Compressed gases, n.o.s. (Air, Isobutylene)
HAZARD CLASS NUMBER and DESCRIPTION:	2.2 (Compressed Gas)
UN IDENTIFICATION NUMBER:	UN 1956
PACKING GROUP:	Not Applicable
DOT LABEL(S) REQUIRED:	Compressed Gas

NORTH AMERICAN EMERGENCY RESPONSE GUIDEBOOK NUMBER (2000): 126

TRANSPORT CANADA TRANSPORTATION OF DANGEROUS GOODS REGULATIONS: This gas mixture is considered as dangerous goods, per regulations of Transport Canada. Use the above information for the preparation of Canadian Shipments.

15. REGULATORY INFORMATION

ADDITIONAL U.S. REGULATIONS:

U.S. SARA REPORTING REQUIREMENTS: The components of this gas mixture are not subject to the reporting requirements of Sections 302, 304 and 313 of Title III of the Superfund Amendments and Reauthorization Act.

U.S. SARA THRESHOLD PLANNING QUANTITY: There are no specific Threshold Planning Quantities for this material. The default Federal MSDS submission and inventory requirement filing threshold of 10,000 lb (4,540 kg) may apply, per 40 CFR 370.20.

U.S. CERCLA REPORTABLE QUANTITY (RQ): Not applicable.

U.S. TSCA INVENTORY STATUS: The components of this product are listed on the TSCA Inventory.

OTHER U.S. FEDERAL REGULATIONS: Not applicable.

15. REGULATORY INFORMATION (Continued)

ADDITIONAL U.S. REGULATIONS (continued):

U.S. STATE REGULATORY INFORMATION: The components of this gas mixture are covered under specific State regulations, as denoted below:

Alaska - Designated Toxic and Hazardous Substances: None.
California - Permissible Exposure Limits for Chemical Contaminants: None.
Florida - Substance List: Isobutylene.
Illinois - Toxic Substance List: None.
Kansas - Section 302/313 List: None.
Minnesota - List of Hazardous Substances: Isobutylene.
Massachusetts - Substance List: None.
Missouri - Employer Information/Toxic Substance List: None.
New Jersey - Right to Know Hazardous Substance List: Isobutylene.
North Dakota - List of Hazardous Chemicals, Reportable Quantities: None.
Pennsylvania - Hazardous Substance List: Isobutylene.
Rhode Island - Hazardous Substance List: None.
Texas - Hazardous Substance List: None.
West Virginia - Hazardous Substance List: None.
Wisconsin - Toxic and Hazardous Substances: None.

CALIFORNIA SAFE DRINKING WATER AND TOXIC ENFORCEMENT ACT (PROPOSITION 65): No component of this product is on the California Proposition 65 Lists.

LABELING: **CAUTION:** HIGH PRESSURE GAS.
MAY ACCELERATE COMBUSTION.

Keep oil and grease away.
Use equipment rated for cylinder pressure.
Close valve after each use and when empty.
Use in accordance with the Material Safety Data Sheet.

FIRST-AID: IF INHALED, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Call a physician.

IN CASE OF FROSTBITE, obtain immediate medical attention.
DO NOT REMOVE THIS PRODUCT LABEL.

ADDITIONAL CANADIAN REGULATIONS:

CANADIAN DSL INVENTORY: The components of this product are listed on the DSL Inventory.

OTHER CANADIAN REGULATIONS: Not applicable.

CANADIAN ENVIRONMENTAL PROTECTION ACT (CEPA) PRIORITIES SUBSTANCES LISTS: The components of this product are not on the CEPA Priorities Substances Lists.

CANADIAN WHMIS SYMBOLS: Class A: Compressed Gases

16. OTHER INFORMATION

PREPARED BY: CHEMICAL SAFETY ASSOCIATES, Inc.
9163 Chesapeake Drive, San Diego, CA 92123-1002
858/565-0302

16. OTHER INFORMATION (Continued)

The information contained herein is based on data considered accurate. However, no warranty is expressed or implied regarding the accuracy of these data or the results to be obtained from the use thereof. AirGas, Inc. assumes no responsibility for injury to the vendee or third persons proximately caused by the material if reasonable safety procedures are not adhered to as stipulated in the data sheet. Additionally, AirGas, Inc. assumes no responsibility for injury to vendee or third persons proximately caused by abnormal use of the material even if reasonable safety procedures are followed. Furthermore, vendee assumes the risk in his use of the material.

DEFINITIONS OF TERMS

A large number of abbreviations and acronyms appear on a MSDS. Some of these which are commonly used include the following:

CAS #: This is the Chemical Abstract Service Number which uniquely identifies each constituent.

EXPOSURE LIMITS IN AIR:
ACGIH - American Conference of Governmental Industrial Hygienists, a professional association which establishes exposure limits. TLV - Threshold Limit Value - an airborne concentration of a substance which represents conditions under which it is generally believed that nearly all workers may be repeatedly exposed without adverse effect. The duration must be considered, including the 8-hour Time Weighted Average (TWA), the 15-minute Short Term Exposure Limit, and the instantaneous Ceiling Level (C). Skin absorption effects must also be considered.

OSHA - U.S. Occupational Safety and Health Administration
PEL - Permissible Exposure Limit - This exposure value means exactly the same as a TLV, except that it is enforceable by OSHA. The OSHA Permissible Exposure Limits are based in the 1989 PELs and the June, 1993 Air Contaminants Rule (Federal Register: 58: 35338-35351 and 58: 40191). Both the current PELs and the vacated PELs are indicated. The phrase, "Vacated 1989 PEL," is placed next to the PEL which was vacated by Court Order.

IDLH - Immediately Dangerous to Life and Health - This level represents a concentration from which one can escape within 30-minutes without suffering escape-preventing or permanent injury. The DFG - MAK is the Republic of Germany's Maximum Exposure Level, similar to the U.S. PEL. NIOSH is the National Institute of Occupational Safety and Health, which is the research arm of the U.S. Occupational Safety and Health Administration (OSHA). NIOSH issues exposure guidelines called Recommended Exposure Levels (RELs). When no exposure guidelines are established, an entry of NE is made for reference.

HAZARD RATINGS:
HAZARDOUS MATERIALS IDENTIFICATION SYSTEM: Health Hazard: 0 (minimal acute or chronic exposure hazard); 1 (slight acute or chronic exposure hazard); 2 (moderate acute or significant chronic exposure hazard); 3 (severe acute exposure hazard, continue overexposure can result in permanent injury and may be fatal); 4 (extreme acute exposure hazard; onetime overexposure can be fatal). Flammability Hazard: 0 (minimal hazard); 1 (materials that require substantial pre-heating before burning); 2 (combustible liquid or solids; liquids with a flash point of 38-93°C [100-200°F]); 3 (Class IB and IC flammable liquids with flash point below 38°C [100°F]); 4 (Class IA flammable liquids with flash points below 23°C [73°F] and boiling points below 38°C [100°F]. Reactivity Hazard: 0 (normally stable); 1 (material that can become unstable at elevated temperatures or which can react slightly with water); 2 (materials that are unstable but do not detonate or which can react violently with water); 3 (materials that can detonate when initiated or which can react explosively with water); 4 (materials that can detonate at normal temperatures or pressures). PERSONAL PROTECTIVE EQUIPMENT CODES: B: Gloves and goggles; C: Gloves, goggles, rubber apron (appropriate body protection); D: Gloves, goggles, faceshield; rubber apron (appropriate body protection); X: Special attention should be given to PPE Selection.

NATIONAL FIRE PROTECTION ASSOCIATION: Health Hazard: 0 (material that on exposure under fire conditions would offer no hazard beyond that of ordinary combustible materials); 1 (materials that on exposure under fire conditions could cause irritation or minor residual injury); 2 (materials that on intense or continued exposure under fire conditions could cause temporary incapacitation or possible residual injury); 3 (materials that can on short exposure could cause serious temporary or residual injury); 4 (materials that under very short exposure could cause death or major residual injury). Flammability Hazard and Reactivity Hazard: Refer to definitions for "Hazardous Materials Identification System".

FLAMMABILITY LIMITS IN AIR:
Much of the information related to fire and explosion is derived from the National Fire Protection Association (NFPA). Flash Point - Minimum temperature at which a liquid gives off sufficient vapors to form an ignitable mixture with air. Autoignition Temperature: The minimum temperature required to initiate combustion in air with no other source of ignition. LEL - the lowest percent of vapor in air, by volume, that will explode or ignite in the presence of an ignition source. UEL - the highest percent of vapor in air, by volume, that will explode or ignite in the presence of an ignition source.

TOXICOLOGICAL INFORMATION:
Possible health hazards as derived from human data, animal studies, or from the results of studies with similar compounds are presented. Definitions of some terms used in this section are: LD_{50} - Lethal Dose (solids & liquids) which kills 50% of the exposed animals; LC_{50} - Lethal Concentration (gases) which kills 50% of the exposed animals; ppm concentration expressed in parts of material per million parts of air or water. mg/m³ concentration expressed in weight of substance per volume of air; mg/kg quantity of material, by weight, administered to a test subject, based on their body weight in kg. Data from several sources are used to evaluate the cancer-causing potential of the material. The sources are: IARC - the International Agency for Research on Cancer; NTP - the National Toxicology Program; RTECS - the Registry of Toxic Effects of Chemical Substances; OSHA and CALOSHA. IARC and NTP rate chemicals on a scale of decreasing potential to cause human cancer with rankings from 1 to 4. Subrankings (2A, 2B, etc.) are also used. Other measures of toxicity include TDLo, the lowest dose to cause a symptom and TCLo the lowest concentration to cause a symptom, TDo, LDLo, and LOo, or TC, TCo, LCLo, and LCo, the lowest dose (or concentration) to cause lethal or toxic effects. BEI - Biological Exposure Indices, represent the levels of determinants which are most likely to be observed in specimens collected from a healthy worker who has been exposed to chemicals to the same extent as a worker with inhalation exposure to the TLV. Ecological Information: EC is the effect concentration in water.

REGULATORY INFORMATION:
This section explains the impact of various laws and regulations on the material. EPA is the U.S. Environmental Protection Agency. WHMIS is the Canadian Workplace Hazardous Materials Information System. DOT and TC are the U.S. Department of Transportation and the Transport Canada, respectively. Superfund Amendments and Reauthorization Act (SARA), the Canadian Domestic/Non-Domestic Substances List (DSL/NDSL), the U.S. Toxic Substance Control Act (TSCA). Marine Pollutant status according to the DOT; the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund); and various state regulations.

APPENDIX C
STANDARD OPERATING PROCEDURES

SOP NUMBER: 7115

Subsurface Soil Sampling by Split Spoon

Date:	3rd Qtr. 1994
Revision Number:	3
Author:	Charles Martin
Discipline:	Geosciencies

1.0 PURPOSE AND APPLICABILITY

1.1 Purpose and Applicability

This Standard Operating Procedure (SOP) describes the methods used in obtaining subsurface soil samples for physical and/or chemical analysis. Subsurface soil samples are obtained in conjunction with soil boring programs and provide information as to the physical and/or chemical makeup of the subsurface environment.

The purpose of this SOP is to provide a description of a specific method or procedure to be used in the collection of subsurface soil samples. Subsurface soil is defined as unconsolidated material which may consist of one or a mixture of the following materials: sand, gravel, silt, clay, peat (or other organic soils), and fill material. Subsurface soil sampling, conducted in accordance with this SOP will promote consistency in sampling and provide a basis for sample representativeness.

This SOP covers subsurface soil sampling by split-spoon only, as this is the means most often used for obtained samples of unconsolidated deposits. Other types of equipment are available for use in subsurface soil sampling, including thin-wall tube samplers (Shelby tubes), piston samplers, and continuous core barrel samplers. Information on the use of these other sampling devices may be found in several available drilling handbooks and respective state and/or federal agency technical guidance documents. The American Society for Testing and Materials (ASTM) also provides procedures for use of split-spoon and other sampling devices.

Deviations from this SOP to accommodate other regulatory requirements should be reviewed in advance of the field program, should be explained in the project work plan, and must be documented in the field project notebook when they occur.

1.2 General Principles

Split-spoon subsurface soil sampling generally requires use of a drilling rig and typically the hollow-stem auger or other common drilling method to generate a borehole in which to use the split-spoon sampler. The split-spoon sampler is

inserted through the augers (or other type of drill casing) then is driven into the subsurface soil with a weighted hammer. The sampler is then retrieved and opened to reveal the recovered soil sample. Soil samples may be collected at a continuous interval or at pre-selected vertically spaced intervals within the borehole.

1.3 Quality Assurance Planning Considerations

Sampling personnel should follow specific quality assurance guidelines as outlined in the site-specific Quality Assurance Project Plan (QAPP). Proper quality assurance requirements should be provided which will allow for collection of representative samples from representative sampling points. Quality assurance requirements outlined in the QAPP typically suggest the collection of a sufficient quantity of field duplicate, field blank, and other samples.

1.4 Health and Safety Considerations

Subsurface soil sampling may involve chemical hazards associated with the types of contaminants potentially encountered and will always involve potential physical hazards associated with use of drilling equipment. When sampling is performed in materials which may contain hazardous constituents, or when the quality assurance objectives of the project require the use of hazardous solvents, adequate Health and Safety measures must be taken to protect sampling personnel. These measures must be addressed in the project Health and Safety Plan (HASP). This plan must be approved by the project Health and Safety Officer before work commences, must be distributed to all personnel performing sampling, and must be adhered to as field activities are performed.

2.0 RESPONSIBILITIES

2.1 Drilling Subcontractor

It will be the responsibility of the drilling subcontractor to provide the necessary materials for obtaining subsurface soil samples. This generally includes one or more split-spoon samplers in good operating condition and sample containers used for stratigraphic characterization samples (sample containers for environmental samples should be provided by the designated analytical laboratory). It is the drilling subcontractor's responsibility to provide and maintain their own boring logs if desired. Equipment decontamination materials should also be supplied by the subcontractor and should meet project specifications.

2.2 Project Geologist/Sampling Engineer

It will be the responsibility of the project geologist/sampling engineer to conduct subsurface soil sampling in a manner which is consistent with this SOP. The project geologist/sampling engineer will observe all activities pertaining to subsurface soil sampling to ensure that the SOP is followed, and to record all pertinent data onto a boring log. It is also the project geologist/sampling engineer's responsibility to indicate the specific targeted sampling depth or sampling interval to the drilling subcontractor. The project geologist/sampling engineer is also responsible for the collection of representative environmental or stratigraphic characterization samples once the sampling device has been retrieved and opened. Additional sample collection responsibilities include labeling, handling, and storage of samples until further chain-of-custody procedures are implemented.

3.0 REQUIRED MATERIALS

In addition to those materials provided by the subcontractor, the project geologist/sampling engineer will require:

- Project Sampling Plan, QAPP, and HASP
- Boring logs
- Teaspoon or spatula (stainless steel is recommended)
- Sample kit (bottles, labels, custody records and tape, cooler)
- Sample collection pen
- Folding rule or tape measure
- Equipment decontamination materials
- Health and safety equipment (as required by HASP)
- Field project notebook/pen

4.0 METHOD

4.1 General Method Description

Split-spoon sampling devices are typically constructed of steel and are most commonly available in lengths of 18 and 24 inches and diameters of 1.5 to 3 inches. The split-spoon consists of a tubular body with two halves that split apart lengthwise, a drive head on the upper end with a ball-check valve for venting, and a hardened steel cutting shoe at the bottom. The soil sample enters the split-spoon through the cutting shoe as the device is driven into the ground. A replaceable plastic or metal basket is often inserted into the shoe to assist with retaining samples. Once the

sampler is retrieved, the drive head and cutting shoes are removed and the split-spoon halves are then separated, revealing the sample.

Sample depth intervals are usually defined on a project-specific basis with these requirements specified in the project sampling plan. Sampling intervals typically range from one (1) sample per five (5) feet of drilling to continuous sampling where the entire drilled interval is sampled.

Subsurface soil sampling is usually accomplished as part of a drilling program where a soil boring is advanced with drilling equipment to the designated depth prior to collection of a representative sample. The general procedures outlined briefly in the following section provide requirements for advancing drill casing/augers in preparation for sampling.

4.2 General Procedures - Borehole Preparation

4.2.1 Advancing Casing/Augers

Soil borings that are completed for soil sampling purposes are typically advanced using hollow-stem augers and sometimes drive-and-wash or other casing methods. The casing/augers must be of sufficient diameter to allow for soil sampling at a minimum. The casing/augers will be advanced according to project requirements to the required depth for sampling. If hollow-stem augers are used, a temporary plug shall be used in the lead auger to prevent the auger from becoming filled with drill cuttings while drilling is in progress.

4.2.2 Obstructions

For those borings which encounter obstructions, the casing/augers will be advanced past or through the obstruction if possible. Caution should be exercised when obstructions are encountered and an effort made to identify the obstruction before drilling is continued. If the obstruction is not easily drilled through or removed, the boring should be relocated to an adjacent location.

4.2.3 Use of Added Water

The use of added or recirculated water during drilling is permitted when necessary. Use of extraneous water should be minimized or avoided if possible as it may impact sample quality. Water usage should be documented in the field notebook. Sampling and analysis of added or

recirculated water may be required for quality assurance purposes (refer to QAPP). If a well is installed within the completed borehole, removal of the added water may be required.

4.3 Sampling Procedure

4.3.1 Equipment Decontamination

Each split-spoon must be decontaminated prior to its initial use and following collection of each soil sample. Site-specific requirements for equipment decontamination should be outlined within the Project Sampling Plan. Equipment decontamination procedures are also outlined within SOP 7600 - Decontamination of Equipment.

4.3.2 Standard Penetration Test

The drilling subcontractor will lower the split-spoon into the borehole. Samples are generally obtained using the Standard Penetration Test (SPT) in accordance with ASTM standards (ASTM D 1586-84). Following this method, the sampler will be driven using the 140-pound hammer with a vertical free drop of 30 inches using two turns of the rope on the cathead. The number of hammer blows required for every 6 inches of penetration will be recorded on the boring log. Blowcount information is used as an indicator of soil density for geotechnical as well as stratigraphic logging purposes. Once the split-spoon has been driven to its fullest extent, or to refusal, it will be removed from the borehole.

4.3.3 Sample Recovery

The split-spoon will be immediately opened upon removal from the casing/auger. The open sampler shall then be screened for volatile organics with a photoionization device (PID) if required by the Project Sampling Plan. If the Sampling Plan also requires individual soil sample headspace screening for volatile organic compounds, then a small portion of the split-spoon sample shall be removed and properly contained for that purpose.

Sample recovery will be determined by the project geologist/sampling engineer who will examine the soil core once the sampler is opened. The length of sample shall then be measured with a folding rule or tape measure. Any portion of the split-spoon contents which are not considered part of the true sample (i.e., heaved soils) will be discarded. If the sample recovery is considered inadequate for sample characterization or analytical testing

purposes, another sample should be collected from the next vertical interval if possible before drilling is reinitiated.

Adequate sample recovery for stratigraphic logging purposes and/or headspace organic vapor testing purposes should be approximately 6 inches. Adequate sample recovery for analytical testing purposes should be a minimum of 12 inches and is somewhat dependent on the type of analytical testing required. In some cases, continuous sampling over a short interval, and compositing of the sample, may be required to satisfy analytical testing requirements. Larger diameter samplers may be used if large volumes of soil are required for analytical testing.

4.3.4 Sample Containment - General

Once retrieved, the sample will be removed from the split-spoon with a teaspoon or spatula and placed into the appropriate sample container. The sample will be split if necessary to meet sampling program requirements. Sample splitting may be necessary to provide individual samples for headspace testing, visual characterization, physical testing, analytical testing, or simply for archiving purposes. In general, most sampling programs are structured around environmental characterization needs; therefore, sample portions required for analytical testing should be collected first. The Project Sampling Plan and QAPP provides specific sample container requirements for each type of sample and should be referred to for guidance.

Once filled, the sample containers should be properly capped, cleaned, and labeled, and chain-of-custody and sample preservation procedures initiated. Sampling equipment should then be properly decontaminated.

4.3.5 Sample Containment - Volatile Organic Analyses

Collection of subsurface soil samples for volatile organic analysis (VOA) is slightly more complex than collection of samples for other routine chemical or physical testing primarily because of the concern for the potential loss of volatiles during the sample collection procedure. To limit the potential for loss of volatiles, the soil sample needs to be obtained as quickly and as directly as possible from the split-spoon. This generally means that the VOA sample is to be collected and placed into the appropriate sample container first. The VOA sample should also be obtained from a discrete portion of the entire sample interval and not composited or homogenized. The remainder of the recovered sample can then be composited, homogenized or split to meet the other testing requirements. The boring log and/or sample logbook should be

filled out to indicate actual sample collection depths for both VOA samples and other portions of the sample which may have been composited over a larger vertical interval.

5.0 QUALITY CONTROL

Quality control requirements are dependent on project-specific sampling objectives. The QAPP will provide requirements for sample preservation and holding times, sample container types, sample packaging and shipment, as well as requirements for the collection of various quality assurance samples such as trip blanks, field blanks, equipment blanks, and field duplicate samples.

6.0 DOCUMENTATION

Various forms are required to ensure that adequate documentation is made of sample collection activities. These forms include:

- Boring logs
- Field log books
- Sample collection records
- Chain-of-custody records
- Shipping labels

Boring logs (Figure 1) will provide visual and descriptive information for each sample collected and are often the most critical form of documentation generated during a sampling program. The field log book is kept as a general log of activities. Chain-of-custody forms are transmitted with the samples to the laboratory for sample tracking purposes. Shipping labels are required if sample coolers are to be transported to the laboratory by a third party (courier service). Original copies of these records should be maintained in the appropriate project files.

Re: Former Hughes Family Market at 5305 Rivergrade Road, Irwindale, California (CUPA No. W819505)

Dear Ms. Flores

Enclosed, please find a copy of the proposed work plan for the subject site for your review and approval. This work plan has been developed in response to the LADPW letter dated June 10, 2004, and electronic correspondence dated June 13, 2005. We trust that the enclosed work plan is adequate and meets your requirements. If you have any questions or concerns, please feel free to contact me at (805) 388-3775.

Sincerely,

Robert Baca
Senior Project Manager

Table 1 – Soil Sampling Plan

1.0 INTRODUCTION

This Site Assessment (SA) Workplan has been prepared for the former Family Hughes Market (Site) distribution center and warehouse, located at 5305 Rivergrade Road in Irwindale, California. The general location of the Site is shown on Figure 1 – Site Location Map. This SA Workplan is being submitted by ENSR on behalf of The Realty Associates Fund V, L.P. (T.A. Realty) in response to correspondence from the Los Angeles County Department of Public Works (LADPW) Environmental Programs Division dated June 13, 2005 requesting vertical and lateral delineation of hydrocarbon-impacted soil.

2.0 SITE BACKGROUND

2.1 Site Status/Site History

The Site operated a gas station on-site to serve the requirements of company vehicles. The USTs associated with the gas station were used from 1992 to 1997-1998. The San Gabriel River is located northwest of the Site, while Rivergrade Road, Arrow Highway, and Interstate 605 are located south, northeast, and west, respectively.

The Site was sold to the Ralph's Grocery chain and was later sold the T.A. Realty. Two 12,000-gallon diesel double-walled Plasteel USTs, one 12,000-gallon gasoline double-walled Plasteel UST, fuel dispensers, and associated piping were removed by TA Realty on July 23, 2003 (URS 2003). Observations made during the UST removal did not detect damage or leakage from the USTs. Soil surrounding the USTs did not exhibit discoloration or odor (URS 2003).

Six soil samples were collected beneath the former locations of the USTs at a depth of approximately 17 feet below ground surface (bgs) (Figure 2). Ten soil samples were collected beneath the former locations of the fuel dispensers at depths ranging from 3 to 4 feet bgs. Three soil sampling were collected beneath the former locations of the piping at depths of approximately 3 to 5.5 feet bgs.

Total petroleum hydrocarbons as gasoline (TPH-g) was detected in four soil samples collected beneath fuel dispensers 1 and 2 and satellite fuel dispensers 2 and 3 at concentrations ranging from 1 to 305 mg/kg. Total petroleum hydrocarbons as diesel (TPH-d) was detected in seven soil samples collected beneath fuel dispensers 1, 2, and 5, satellite fuel dispensers 2 and 3, and UST T2 at concentrations ranging from 10 to 6,370 mg/kg. Toluene was detected in one soil sample collected beneath dispenser 5 (FD5-4) at a concentration of 0.003 milligrams per kilogram (mg/kg). Methyl tert-butyl ether (MTBE) was detected at concentration ranging from 0.014 to 0.071 mg/kg in soil samples collected beneath dispenser 5 (FD5-4) and the tank 1 excavation (T1A-17), respectively. Benzene, ethylbenzene, xylenes, and oxygenate compounds were not detected in soil samples collected during the excavation activities.

Additional soil was excavated following review of the laboratory results on August 27, 2003 (URS 2003). Soil was excavated in the vicinity of the former locations of dispensers 1 and 2 to depths of approximately 9.5 feet bgs, satellite dispenser 2 to a depth of approximately 9.5 feet bgs, satellite dispenser 3 to a depth of approximately 8 feet bgs, and UST T2 to a depth of approximately 21 feet bgs. Soil samples collected during this excavation event did not contain detectable concentrations of benzene, toluene, ethylbenzene, or xylenes (BTEX). MTBE was detected in one soil sample collected beneath T2A at a concentration of 0.021 mg/kg. Another analysis was run to confirm the presence of MTBE, however, and results indicated no detectable concentrations of MTBE. The previous results were therefore not considered valid (URS 2003). One soil sample (collected beneath fuel dispensers 1 and 2) contained TPH-g and TPH-d at concentrations of 2.3 and 481 mg/kg, respectively (URS 2003).

On September 28, 2003, a third excavation was performed in the vicinity of the former locations of dispensers 1 and 2 to a depth of approximately 11 feet bgs to remove residual impacts detected during the previous excavation. TPH-d concentrations did not exceed 15 mg/kg, and MTBE concentrations did not exceed 0.071 mg/kg. Residual hydrocarbon concentrations were below preliminary

remediation goals (PRGs) for industrial soil. Based on confirmation soil sampling following this final excavation event, URS (2003) recommended that additional excavation would undermine the concrete slab adjacent to the fieldwork, and that no further excavation be necessary. In all, 47 tons of soil was excavated and transported off-site for disposal. The excavations were backfilled with clean, imported fill and resurfaced with six inches of steel-reinforced concrete.

The LADPW responded to TA Realty in a letter dated June 10, 2004, that additional assessment was required to evaluate the presence of hydrocarbon-impacted soil (Appendix A). In March 2005, URS, on behalf of TA Realty, submitted a workplan to the LADPW proposing two soil borings in the vicinity of UST T1 and UST T2. In electronic correspondence dated June 13, 2005, the LADPW indicated that the subsurface assessment should include ten soil borings in the vicinity of UST T1, UST T2, and the fuel dispenser.

2.2 Site Geology and Hydrogeology

The Site is located in the northern half of the San Gabriel Valley and approximately 3.5 miles south of the San Gabriel Mountains. Soil beneath the Site consists primarily of alluvium deposits consisting of unconsolidated gravel and sand (URS 2003). Previous assessments show that sand and gravel extend to depths greater than 500 feet bgs The sand and gravel deposits are underlain by older alluvial deposits consisting of gravel, sand, silt, and clay to depths greater than 2,000 feet bgs. The middle and upper Miocene Puente and Topanga Formations underlie the alluvial deposits to an unknown depth.

The Site is located in the central area of the San Gabriel Valley groundwater basin. The basin is bounded to the north by the San Gabriel Mountains, to the south and west by the San Jose, Puente, Merced, and Repetto Hills, to the northwest by the Raymond fault, and to the east by uplifted bedrock. The principle water bearing units consist of unconsolidated and semi-consolidated alluvial sediments.

The nearest municipal well to the Site is Los Angeles County Well No. 4239H, located approximately 1,700 feet to the southeast (Figure 1). Depth to water measurements in 2003 indicate that groundwater beneath the Site is approximately 200 feet bgs. The gradient and flow direction of the shallow aquifer is not known, but the regional topography suggests that groundwater flows to the south-southwest.

3.0 FIELD SAMPLING PLAN

3.1 Underground Utility Clearance

The proposed boring locations will be marked in white spray paint, survey flags, or wooden stakes. ENSR will then contact Underground Service Alert (USA) to locate and mark the underground utilities serving the subject property. In addition, the proposed boring locations will be independently delineated to approximately 8 feet bgs for underground utilities through the use of an air knife rig.

3.2 Health and Safety Plan

A Health and Safety Plan (HASP) has been prepared for the on-site activities. The HASP provides an assessment of known hazards and evaluations of the risks associated with conducting the field work at the subject property. Available site information has been examined to select and implement appropriate warnings and safeguards for field personnel. A copy of the HASP is included in Appendix B.

3.3 Permits

Permits will not be required for the scope of work because the soil borings will not encounter water nor will the proposed boring locations encroach on public right of way.

3.4 Soil and Groundwater Sampling Rationale

On March 21, 2005, URS submitted a workplan on behalf of TA Realty to the LADPW proposing two confirmation soil borings in the vicinity of UST T1 and UST T2 in preparation for site closure. LADPW, in electronic correspondence dated June 13, 2005, stated that they required ten soil borings in the vicinity of the USTs and fuel dispensers to evaluate the vertical and lateral extent of hydrocarbon-impacted soil. In accordance with the LADPW requirements, the ten proposed soil boring locations will evaluate the presence and extent of residual petroleum hydrocarbons and oxygenates in the vicinity of the former locations of the USTs, fuel dispensers, and associated piping.

Soil borings SB-1 will be locate five feet north of USTs T1 and T2 and will evaluate the vertical extent of petroleum hydrocarbons. Soil borings SB-2 through SB-4 will evaluate the vertical extent of petroleum hydrocarbons beneath satellite dispenser 2, fuel dispensers 1 and 2, and satellite dispenser 3, respectively. Soil borings SB-5 through SB-7 will be located around the perimeter of the assessment area to evaluate the horizontal extent of petroleum hydrocarbons.

3.5 Soil Borings, Soil Sampling and Handling Procedures

ENSR will use a hydraulically operated truck-mounted hollow stem auger drill rig to advance and sample seven soil borings at the site (approximate locations on Figure 3). Soil samples will be collected at five foot intervals to the total depth of each boring. Soil sampling for boring SB-1 will begin at approximately 20 feet bgs because the tank excavations advanced to a depth of approximately 21 feet bgs and extend to a minimum depth of approximately 40 feet bgs to confirm vertical delineation of petroleum hydrocarbons. Soil sampling for SB-2 through SB-4 will begin at approximately 10 feet bgs

and extend to a minimum depth of approximately 30 feet bgs to confirm vertical delineation of petroleum hydrocarbons beneath the fuel dispensers. Soil sampling for SB-5 through SB-7 will begin at approximately 10 feet bgs and end at approximately 40 feet bgs to confirm horizontal delineation of petroleum hydrocarbons.

The soil samples will be selected in accordance with the sampling plan summarized in Table 1 (Standard Operating Procedures for soil sampling by split spoon are located in Appendix C). It should be noted, that based on field observations of obvious impacts, additional soil samples may be collected and analyzed to properly characterize the nature of observed impacts.

Soil and groundwater samples will be labeled sequentially, 1, 2, 3, etc... with the prefix "SB" to represent the soil boring location they are taken from. Each soil sample will also be labeled with the depth at which it was taken; for example, the soil sample collected at a depth of five feet bgs from boring SB-1 would be labeled as SB-1-5. If refusal is encountered in a boring and the boring is relocated to avoid the subsurface obstruction, the relocated boring will be identified with the original boring number using an upper case letter suffix (i.e. SB-1-5A). If refusal continues to be encountered in the soil borings, ENSR will use a sonic drill rig to advance the soil borings through large cobbles and boulders.

Soil samples will be collected using a stainless steel split spoon sampler fitted with three, six-inch long pre-cleaned brass or stainless steel sampling sleeves. The split spoon sampler will be driven into undisturbed soil ahead of the lead auger by a 140-pound down-hole hammer.

The samples will be field screened for the presence of VOCs using a field photoionization detector (PID) and observed for visual impacts and olfactory evidence of contamination. The soil samples collected from the borings will be collected in brass sample sleeves, the ends of which will be covered in Teflon® tape and capped with plastic end caps. The soil samples that will be analyzed for VOCs, TPH-g, and TPH-d will be extracted and preserved in accordance with EPA Method 5035. The sample containers will be sealed, labeled, recorded on a chain-of-custody (COC) form and placed in ice chests pending delivery to the analytical laboratory.

3.6 Quality Assurance/Quality Control

ENSR will collect duplicate or collocated replicate soil samples equal to ten percent of the total number of samples collected during the project. One trip blank per cooler will accompany the samples to the laboratory for quality control/quality assurance (QA/QC) purposes.

3.7 Laboratory Analysis

Soil and groundwater samples will be analyzed by a California-certified hazardous waste testing laboratory by EPA Method 8015 for TPH-g and TPH-d, and EPA Method 8260B for BTEX and oxygenates.

3.8 Investigation Derived Wastes

Soil cuttings generated from the drilling activities will be placed in Department of Transportation (DOT) approved 55-gallon drums or roll-off bins, labeled appropriately, and stored on-site pending the receipt of laboratory analytical results. Following receipt of the analytical results and confirmation that the soil

is not considered hazardous, the soil will transported to an appropriate disposal facility. If the soil is determined to be hazardous, it will be transported off-site for disposal at an appropriately permitted facility.

Decontamination (decon) water and purge water generated by sampling activities will also be stored on-site in DOT-approved 55-gallon drums. Following receipt of the analytical results and confirmation that the decon water is not hazardous, the water will be disposed of on-site. If the decon water is determined to be hazardous, the water will be transported offsite for disposal at an appropriately permitted facility.

4.0 REPORTING

Upon completion of the field activities and receipt of the final laboratory analytical results, a technical report summarizing the results of this project will be prepared for submittal to the LADPW. The report will be prepared under the supervision of and signed by a California Professional Geologist. The report will summarize field activities and observations. It will document any variances from this Work Plan that were required in the field. The report will also summarize the laboratory analytical results obtained and include copies of the certified laboratory analytical transcripts provided by the analytical laboratory. The report will summarize the results and QA/QC efforts and present ENSR's conclusions based on the available information. Finally, the report will present our recommendations regarding the need for additional assessment or for site closure, as applicable.

		SB-6-40	40	TPH-g, TPH-d, BTEX, Oxygenates
South of Site	SB-7	SB-7-10	10	TPH-g, TPH-d, BTEX, Oxygenates
		SB-7-15	15	TPH-g, TPH-d, BTEX, Oxygenates
		SB-7-20	20	TPH-g, TPH-d, BTEX, Oxygenates
		SB-7-25	25	TPH-g, TPH-d, BTEX, Oxygenates
		SB-7-30	30	TPH-g, TPH-d, BTEX, Oxygenates
		SB-7-35	35	TPH-g, TPH-d, BTEX, Oxygenates
		SB-7-40	40	TPH-g, TPH-d, BTEX, Oxygenates

Notes:

All depths are reported in feet below ground surface.

Sampling depth to be analyzed assumes that there are no significant PID readings (greater than 25 PPM) or visual or olfactory - evidence of contamination. Evidence of elevated PID readings would call for sampling at that depth.

TPH-g - Total petroleum hydrocarbons as gasoline analyzed by EPA Method 8015M.

TPH-d - Total petroleum hydrocarbons as diesel analyzed by EPA Method 8015M.

BTEX - Benzene, toluene, ethylbenzene, xylenes analyzed by EPA Method 8260B.

HAZARDOUS MATERIAL UNDERGROUND STORAGE
CLOSURE REPORT
CLOSURE PERMIT NUMBER 373090
FACILITY LOCATION: 5305 NORTH RIVERGRADE ROAD, IRWINDALE

This office has reviewed the closure report dated November 3, 2003, for the subject facility.

In order to better evaluate the report, the information indicated on the enclosed Additional Closure Requirements sheet must be submitted to this office by August 18, 2004.

If you have any questions regarding this matter, please contact Mr. Andrew Ngumba, of this office, at (626) 458-3513, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

ADDITIONAL CLOSURE REQUIREMENTS

The additional information or requirements checked below must be submitted to the County of Los Angeles Department of Public Works, Environmental Programs Division, P.O. Box 1460, Alhambra, CA 91802-1460, in order to complete evaluation of Closure Permit No. 373090.

[ ] Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets, and north arrow.

[ ] Insufficient number of samples was obtained. Additional samples required in accordance with attached Closure Permit Requirements.

[ ] Describe method of obtaining, handling, and/or transporting samples.

[ ] Indicate time and date samples were obtained.

[X] Submit logs certified by a CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils for all borings.

[ ] Submit chain-of-custody documentation initiated by person obtaining sample through person at Department of Health Services certified laboratory.

[ ] Disposal destination of tanks and evidence of legal disposal.

[ ] Analysis results by a State certified laboratory shall be submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

[ ] Documentation as to depth of groundwater at facility.

[ ] Manifests to document hazardous waste disposal of removed soil/tank rinsate with the signature of the disposal facility owner/operator.

[ ] Evidence of legal disposal of soils designated as non-hazardous.

[X] Signature on the report is required of CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils. <u>The report must clearly indicate that all soil sampling was done under the supervision of the registered professional.</u>

[X] Submit a work plan to define the lateral and vertical extent of contamination.

[X] Complete borings to groundwater or complete borings which penetrate to a minimum depth of 25 feet below the deepest detectable contamination. Borings shall be sampled and analyzed at five-foot intervals. EPA 5035 soil sampling guidelines must be utilized. All samples shall be analyzed for BTEX, MTBE, and oxygenate compounds using EPA 8260B, and for gasoline and diesel using EPA 8015(M). A voluntary cleanup oversight fee of $443 must be submitted for the review of future submittals regarding this site.

HAZARDOUS MATERIALS UNDERGROUND STORAGE TANKS
LANDOWNER NOTIFICATION AND PARTICIPATION REQUIREMENTS
FACILITY LOCATION: 5305 NORTH RIVERGRADE ROAD, IRWINDALE

This letter is to inform you of legislative requirements pertaining to cleanup and closure of sites where an unauthorized release of hazardous substance, including petroleum, has occurred from an underground storage tank (UST). Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code requires the primary or active responsible party to notify all current record owners of fee title to the site of: 1) a site cleanup proposal, 2) a site closure proposal, 3) a local agency intention to make a determination that no further action is required, and 4) a local agency intention to issue a closure letter. Section 25297.15(b) requires the local agency to take all reasonable steps to accommodate responsible landowners' participation in the cleanup or site closure process and to consider their input and recommendations.

For purposes of implementing these sections, you have been identified as the primary or active responsible party. Please provide to this agency, within 20 calendar days of receipt of this notice, the assessor parcel number(s) for the site and a complete mailing list of all current record owners of fee title to the site. You may use the enclosed list of landowners form (sample letter 2) to comply with this requirement. If the list of current record owners of fee title to the site changes, you must notify the local agency of the change within 20 calendar days from when you are notified of the change.

If you are the sole landowner, please indicate that on the landowner list form. The following notice requirements do not apply to responsible parties who are the sole landowner for the site.

In accordance with Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code, you must certify to the local agency that all current record owners of fee title to the site have been informed of the proposed action before the local agency may do any of the following:

1) Consider a cleanup proposal (corrective action plan)
2) Consider a site closure proposal
3) Make a determination that no further action is required
4) Issue a closure letter

You may use the enclosed notice of proposed action form (sample letter 3) to comply with this requirement. Before approving a cleanup proposal or site closure proposal, determining that no further action is required, or issuing a closure letter, the local agency will take all reasonable steps necessary to accommodate responsible landowner participation in the cleanup and site closure process and will consider all input and recommendations from any responsible landowner.

Please submit the certification within 20 days from the date of this letter. June 30th

Initial voluntary cleanup oversight fee of $443 must be paid prior to any report review. An additional fee of $147 per hour will be charged for each hour of assessment review which exceeds the initial three-hour review estimation.

Should you have any questions regarding this matter, please contact Mr. Andrew Ngumba, of this office, at (626) 458-3513, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

Dear Wohl Property Group:

HAZARDOUS MATERIALS UNDERGROUND STORAGE PERMIT
CLOSURE CERTIFICATION NOTICE
CLOSURE APPLICATION NO. A373090
FACILITY LOCATED AT 5305 NORTH RIVERGRADE ROAD, IRWINDALE, (3S)

This letter confirms the completion of a site investigation and corrective action for the underground storage tank (UST) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former UST are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your UST site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the California Health and Safety Code (CH&SC) and with corrective action regulations adopted pursuant to Section 25299.3 of the CH&SC and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the California Health and Safety Code.

If you have any questions, please contact Ms. Abigail Flores of this office at (626) 458-3561, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

DONALD L. WOLFE

HAZARDOUS MATERIALS UNDERGROUND STORAGE PERMIT
CLOSURE CERTIFICATION NOTICE
CLOSURE APPLICATION NO. A373090
FACILITY LOCATED AT 5305 NORTH RIVERGRADE ROAD, IRWINDALE, (3S)

This letter confirms the completion of a site investigation and corrective action for the underground storage tank (UST) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former UST are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your UST site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the California Health and Safety Code (CH&SC) and with corrective action regulations adopted pursuant to Section 25299.3 of the CH&SC and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the California Health and Safety Code.

If you have any questions, please contact Ms. Abigail Flores of this office at (626) 458-3561, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

HAZARDOUS MATERIALS UNDERGROUND STORAGE TANKS
LANDOWNER NOTIFICATION AND PARTICIPATION REQUIREMENTS
FACILITY LOCATION: 5305 NORTH RIVERGRADE ROAD, IRWINDALE

This letter is to inform you of legislative requirements pertaining to cleanup and closure of sites where an unauthorized release of hazardous substance, including petroleum, has occurred from an underground storage tank (UST). Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code requires the primary or active responsible party to notify all current record owners of fee title to the site of: 1) a site cleanup proposal, 2) a site closure proposal, 3) a local agency intention to make a determination that no further action is required, and 4) a local agency intention to issue a closure letter. Section 25297.15(b) requires the local agency to take all reasonable steps to accommodate responsible landowners' participation in the cleanup or site closure process and to consider their input and recommendations.

For purposes of implementing these sections, you have been identified as the primary or active responsible party. Please provide to this agency, within 20 calendar days of receipt of this notice, the assessor parcel number(s) for the site and a complete mailing list of all current record owners of fee title to the site. You may use the enclosed list of landowners form (sample letter 2) to comply with this requirement. If the list of current record owners of fee title to the site changes, you must notify the local agency of the change within 20 calendar days from when you are notified of the change.

If you are the sole landowner, please indicate that on the landowner list form. The following notice requirements do not apply to responsible parties who are the sole landowner for the site.

In accordance with Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code, you must certify to the local agency that all current record owners of fee title to the site have been informed of the proposed action before the local agency may do any of the following:

1) Consider a cleanup proposal (corrective action plan)
2) Consider a site closure proposal
3) Make a determination that no further action is required
4) Issue a closure letter

You may use the enclosed notice of proposed action form (sample letter 3) to comply with this requirement. Before approving a cleanup proposal or site closure proposal, determining that no further action is required, or issuing a closure letter, the local agency will take all reasonable steps necessary to accommodate responsible landowner participation in the cleanup and site closure process and will consider all input and recommendations from any responsible landowner.

Please submit the certification within 20 days from the date of this letter.

Initial voluntary cleanup oversight fee of $443 must be paid prior to any report review. An additional fee of $147 per hour will be charged for each hour of assessment review which exceeds the initial three-hour review estimation.

Should you have any questions regarding this matter, please contact Mr. Andrew Ngumba, of this office, at (626) 458-3513, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

JAMES A. NOYES

Dear Wohl Property Group:

HAZARDOUS MATERIALS UNDERGROUND STORAGE PERMIT
CLOSURE CERTIFICATION NOTICE
CLOSURE APPLICATION NO. A373090
FACILITY LOCATED AT 5305 NORTH RIVERGRADE ROAD, IRWINDALE, (3S)

This letter confirms the completion of a site investigation and corrective action for the underground storage tank (UST) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former UST are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your UST site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the California Health and Safety Code (CH&SC) and with corrective action regulations adopted pursuant to Section 25299.3 of the CH&SC and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the California Health and Safety Code.

If you have any questions, please contact Ms. Abigail Flores of this office at (626) 458-3561, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

DONALD L. WOLFE

ADDITIONAL CLOSURE REQUIREMENTS

The additional information or requirements checked below must be submitted to the County of Los Angeles Department of Public Works, Environmental Programs Division, P.O. Box 1460, Alhambra, CA 91802-1460, in order to complete evaluation of Closure Permit No. 373090.

[ ] Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets, and north arrow.

[ ] Insufficient number of samples was obtained. Additional samples required in accordance with attached Closure Permit Requirements.

[ ] Describe method of obtaining, handling, and/or transporting samples.

[ ] Indicate time and date samples were obtained.

[X] Submit logs certified by a CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils for all borings.

[ ] Submit chain-of-custody documentation initiated by person obtaining sample through person at Department of Health Services certified laboratory.

[ ] Disposal destination of tanks and evidence of legal disposal.

[ ] Analysis results by a State certified laboratory shall be submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

[ ] Documentation as to depth of groundwater at facility.

[ ] Manifests to document hazardous waste disposal of removed soil/tank rinsate with the signature of the disposal facility owner/operator.

[ ] Evidence of legal disposal of soils designated as non-hazardous.

[X] Signature on the report is required of CA registered geologist, CA certified engineering geologist, or CA registered civil engineer with sufficient experience in soils. <u>The report must clearly indicate that all soil sampling was done under the supervision of the registered professional.</u>

[X] Submit a work plan to define the lateral and vertical extent of contamination.

[X] Complete borings to groundwater or complete borings which penetrate to a minimum depth of 25 feet below the deepest detectable contamination. Borings shall be sampled and analyzed at five-foot intervals. EPA 5035 soil sampling guidelines must be utilized. All samples shall be analyzed for BTEX, MTBE, and oxygenate compounds using EPA 8260B, and for gasoline and diesel using EPA 8015(M). A voluntary cleanup oversight fee of $443 must be submitted for the review of future submittals regarding this site.

HAZARDOUS MATERIALS UNDERGROUND STORAGE TANKS
LANDOWNER NOTIFICATION AND PARTICIPATION REQUIREMENTS
FACILITY LOCATION: 5305 NORTH RIVERGRADE ROAD, IRWINDALE

This letter is to inform you of legislative requirements pertaining to cleanup and closure of sites where an unauthorized release of hazardous substance, including petroleum, has occurred from an underground storage tank (UST). Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code requires the primary or active responsible party to notify all current record owners of fee title to the site of: 1) a site cleanup proposal, 2) a site closure proposal, 3) a local agency intention to make a determination that no further action is required, and 4) a local agency intention to issue a closure letter. Section 25297.15(b) requires the local agency to take all reasonable steps to accommodate responsible landowners' participation in the cleanup or site closure process and to consider their input and recommendations.

For purposes of implementing these sections, you have been identified as the primary or active responsible party. Please provide to this agency, within 20 calendar days of receipt of this notice, the assessor parcel number(s) for the site and a complete mailing list of all current record owners of fee title to the site. You may use the enclosed list of landowners form (sample letter 2) to comply with this requirement. If the list of current record owners of fee title to the site changes, you must notify the local agency of the change within 20 calendar days from when you are notified of the change.

If you are the sole landowner, please indicate that on the landowner list form. The following notice requirements do not apply to responsible parties who are the sole landowner for the site.

In accordance with Section 25297.15(a) of Chapter 6.7 of the Health and Safety Code, you must certify to the local agency that all current record owners of fee title to the site have been informed of the proposed action before the local agency may do any of the following:

1) Consider a cleanup proposal (corrective action plan)
2) Consider a site closure proposal
3) Make a determination that no further action is required
4) Issue a closure letter

You may use the enclosed notice of proposed action form (sample letter 3) to comply with this requirement. Before approving a cleanup proposal or site closure proposal, determining that no further action is required, or issuing a closure letter, the local agency will take all reasonable steps necessary to accommodate responsible landowner participation in the cleanup and site closure process and will consider all input and recommendations from any responsible landowner.

Please submit the certification within 20 days from the date of this letter.

Initial voluntary cleanup oversight fee of $443 must be paid prior to any report review. An additional fee of $147 per hour will be charged for each hour of assessment review which exceeds the initial three-hour review estimation.

Should you have any questions regarding this matter, please contact Mr. Andrew Ngumba, of this office, at (626) 458-3513, Monday through Thursday, 7 a.m. to 5:30 p.m.

RE: **Closure Assessment Work Plan Addendum**
Former Hughes Family Market
5305 Rivergrade Road
Irwindale, CA 91706
DPW Permit Application No. 373090
CUPA No. W819505
For The Realty Associates Fund V, L.P.

Dear Mr. Rodriguez:

The following closure assessment work plan addendum is being submitted on behalf of The Realty Associates Fund V, L.P. for the above listed property (Site). URS submitted a closure assessment work plan dated March 21, 2005 to the County of Los Angeles Department of Public Works, Environmental Programs Division (LADPW) for review. The addendum is being submitted in response to the LADPW's request to expand the proposed scope of work and include additional boring locations. Revisions to the proposed scope of work were discussed on April 12, 2005 during a phone conference that included Mr. Eric Rodriquez of the LADPW, J.S. (Scott) Rowlands of URS Corporation, and Maureen Hill Collins of Haley & Aldrich, Inc.

Mr. Rodriquez has indicated that his primary concern is the level of total petroleum hydrocarbons (TPH) remaining in place. There are no published preliminary remediation goals (PRGs) by the USEPA Region 9 for TPH. However, the residual concentrations of TPH as diesel fuel (TPHd) remaining in soil are several orders of magnitude below the Maximum Soil Screening Levels for Soils Above Drinking Water Aquifers provided in the Interim Site Assessment and Cleanup Guidebook (RWQCB, 1996). Although confirmatory samples obtained after soil excavation indicated that the concentrations of TPH remaining on-site in the UST excavations was "non-detect", and only 11 milligrams per kilogram (mg/kg) in one of five confirmatory samples from the excavation at one of the fuel dispensers (FD1), we have agreed to conduct explorations to confirm the vertical extent of the "contamination".

However, we believe that the eight borings requested by LADPW are not warranted based on the existing data and level of remediation previously conducted. In particular, we believe that the existing data can be used to establish the lateral extent of "contamination". The confirmatory samples obtained from the underground storage tank (UST) excavations and the five samples taken at the base of each remedial excavation confirm that "contamination" has not spread

URS Corporation
2020 East First Street, Suite 400
Santa Ana, CA 92705
Tel: 714.835.6886
Fax. 714 667.7147

laterally. Mr. Rodriquez is quoting the LADPW Guidelines for Report Submittals (Revised June 1993) in substantiating these requirements. However, as discussed below, and because there is a significant amount of data indicating that large scale fuel releases have not occurred at this site and that elevated levels of TPH do not remain on-site, we believe that our proposed scope of work is in line with the LADPW Guidelines. We therefore request that the additional assessment be limited to two exploratory borings.

Background

The former Hughes Family Markets distribution center and warehouse located at 5305 Rivergrade Road in the City of Irwindale, California, operated a gas station to serve the requirements of company vehicles. Hughes Family Markets was sold to the Ralph's Grocery chain and the assets of Hughes Family Markets integrated into the Ralph's system. The warehouse located at Rivergrade Road was surplus to Ralph's operations and was sold to The Realty Associates Fund V, L.P. (owners). The owners did not need an operational gas station on their property for their current needs and to comply with State and County regulations a decision was made to remove the three USTs and related piping and apply for regulatory closure.

Three 12,000-gallon USTs were removed from the Site under a permit from the LADPW on July 23, 2003. Two of the three USTs removed were used to store diesel fuel and one was used to store unleaded gasoline. The USTs were double-walled Plasteel with appropriate alarms, spill containment, and overflow protection devices installed to ensure against spills and leaks from the operating systems. These USTs were reportedly installed in 1992 and were last used in 1997-1998. Leaks from the USTs were not reported during their operational period.

All operations related to the removal of the USTs were conducted in the presence of the inspector from LADPW. The USTs were not damaged or otherwise compromised and there were no signs of leakage from the USTs. In addition, the soil removed from the excavation at the time of the tank removals did not show any discoloration or significant odor. Groundwater was not encountered in any of the excavations. Based on data from surrounding areas the depth to groundwater beneath the Site is estimated to be approximately 200 feet below ground surface (bgs).

Per the requirements of the UST closure permit, soil samples were obtained from beneath the removed USTs, product piping, and fuel dispensers using an excavator and/or backhoe. At the time of the UST removals, six samples and one duplicate sample were collected underneath the former USTs at a depth of 17 feet bgs. Ten samples and one duplicate sample were collected from beneath the former fuel dispensers at 4 feet bgs with the exception of the sample taken beneath the satellite fuel dispenser #1 (SFD1), which was taken at 3 feet bgs. Three samples were collected from selected locations beneath removed product piping at depths of 3 to 5½ feet bgs. In addition the soil removed from the UST excavation was staged on the paved ground

surface. To check the quality of the excavated material two composite samples were taken from the excavated soil stockpile. All soil samples were analyzed for volatile organic compounds (VOCs) and were collected with Encore™ samplers in accordance with the current EPA method 5035 protocol required by the Regional Water Quality Control Board, Los Angeles Region (RWQCB).

The soil samples were analyzed in a fixed laboratory for TPH as gasoline (TPHg) and TPHd, by EPA Method 8015M, and for volatile fuel constituents benzene, toluene, ethylbenzene, total xylenes (BTEX) and fuel oxygenates Methyl tert-Butyl Ether (MTBE), Di-isopropyl Ether (DIPE), Ethyl tert-butyl Ether (ETBE), tert-Amyl Methyl Ether (TAME) and tert-Butanol (TBA) by EPA Method 8260B.

BTEX, DIPE, ETBE, TAME, and TBA, were not detected at or above laboratory reporting limits in any of the soil samples collected, excluding one sample from fuel dispenser 5 (FD5) which contained 0.003 mg/kg of toluene. MTBE was detected in soil samples at concentrations ranging from 0.014 to 0.071 mg/kg at locations under fuel dispenser 5 and the UST T1 excavation respectively. TPHg was detected in three soil samples at concentrations ranging from 1 mg/kg to 305 mg/kg. TPHd was detected in six soil samples at concentrations ranging from 10 mg/kg to 6,340 mg/kg.

Following a review of the laboratory analytical results, it was decided to excavate the areas showing signs of petroleum hydrocarbon impacts based on laboratory data. The next round of excavation for impacted soil was conducted on August 27, 2003 in the area of fuel dispensers 1 and 2 (FD1 and FD2), satellite fuel dispensers 2 and 3 (SFD2 and SFD3), and UST T2. The objective of this operation was to remove accessible soil affected with petroleum hydrocarbons prior to backfilling and repaving the former UST and fuel dispensing area. Soil was removed to a depth of several feet below the previous soil sampling locations. Specifically, the soil beneath FD1 and FD2 was removed to a depth of approximately 9½ feet bgs. Soil beneath SFD 2 was removed to depth of approximately 9½ feet bgs. Soil beneath SFD 3 was removed to a depth of approximately 8 feet bgs. Soil beneath removed UST T2 was removed to a depth of approximately 21 feet bgs. Following this round of excavation confirmation soil samples were collected from the bottom and sides of the excavation to verify soil conditions. All soil sampling were conducted per RWQCB protocols.

A review of laboratory analytical results for soil samples collected August 27, 2003 indicated further excavation was required in selected areas. This led to an additional several feet of soil being removed from the areas of FD 1 and FD 2 on September 28, 2003. Additional soil was removed from the bottom of the excavation to a depth of approximately 11 feet bgs.

A total of 21 confirmation samples were collected from the remedial excavations to confirm that impacted soil was removed from the targeted locations. Five samples were collected in the

vicinity of the former UST T2 and 16 samples were collected from beneath the former fuel dispensers at various depths.

Approximately 47 tons of petroleum hydrocarbon affected soil excavated from the areas of the UST T2 and fuel dispensers 1 and 2 and satellite fuel dispensers 2 and 3 was transported to Thermal Remediation Solutions in Azusa, California for disposal/recycling.

Confirmatory sampling provided the following results: BTEX and MTBE were not detected at or above laboratory reporting limits in any of the soil samples collected, excluding one sample from beneath UST T2 which contained 0.021 mg/kg of MTBE. However, this sample was re-analyzed for MTBE by EPA method 8260B and the MTBE detection was not confirmed and therefore is not considered valid. TPHg was detected in one soil sample collected beneath fuel dispensers 1 and 2 at concentration of 2.3 mg/kg. TPHd was detected in soil samples at concentrations ranging from 11 mg/kg to 481 mg/kg. It should be noted that additional soil was excavated in the area of the 481 mg/kg detection, and a second confirmation sample collected from this location yielded a non-detect concentration of TPHd.

Confirmation samples collected from the excavations indicate the residual concentrations of TPHd remaining in soil do not exceed 15 mg/kg. Residual concentrations of toluene remaining in soil do not exceed 0.003 mg/kg. Residual concentrations of MTBE remaining in soil do not exceed 0.071 mg/kg. During the field work it was decided that the residual concentrations were not high enough to warrant further excavation, especially when the excavation was caving in and undermining the concrete slab adjacent to the excavation.

The residual concentrations of toluene detected in soil are below USEPA Preliminary Remediation Goals (PRGs). There are no published PRGs for TPH. However, the residual concentrations of TPHd remaining in soil are several orders of magnitude below the Maximum Soil Screening Levels for Soils Above Drinking Water Aquifers provided in the Interim Site Assessment and Cleanup Guidebook (RWQCB, 1996). The published soil screening levels for TPH have since been rescinded but are still observed by multiple oversight agencies.

Because of its potential effects on groundwater quality, MTBE was further evaluated. The residual concentrations of MTBE detected in soil are below USEPA PRGs and above California Drinking Water Maximum Contaminant Levels (MCLs). Based on field observations, the MTBE detections were rapidly decreasing with depth and the residual concentrations left is place are likely below detectable concentrations well before 50 feet bgs. In, addition, the residual concentrations of TPH and toluene remaining in soil are at low levels and were rapidly decreasing with depth.

Additional Assessment

The LADPW has requested that multiple borings (8) be drilled in the area of the removed USTs to determine the lateral and vertical extent of petroleum hydrocarbon impacts. This request appears to be based on Section VI, Item C of LADPW Guidelines for Report Submittals (Revised June 1993) that states "Generally, a minimum number of borings is required for each tank or tank cluster as indicated below....four borings around a double or triple tank cluster." However, Appendix B-Excavation Procedures of the guidelines indicates that "at minimum, one boring must be drilled per source area, if borings were not performed beforehand to fully define the plume." Based on the post-excavation confirmatory data indicating "non-detect" TPH remaining in place, we do not believe there is a hydrocarbon "plume" beneath the site. However, we are willing to conduct additional exploration to assess the vertical extent of residual TPH impact.

It is requested that the LADPW consider the following points in support of limiting the proposed scope of work to two sonic borings (one boring in the location of removed UST T2, and one boring in the area of removed dispensers FD1/FD2 and SFD2):

- Realty Associates Advisors has agreed to remove the canopy at the Site so as to facilitate drilling in the former area of fuel dispensers FD1/FD2 and SFD2.
- The Site geology is comprised of coarse grained material such as sands and gravels. Contaminant plumes in these types of materials are going to migrate primarily in a vertical fashion (typically in the shape of an inverted cone) and have limited lateral spread.
- Soil sampling data collected during the UST removals and subsequent soil removal actions adequately defined the lateral limits of impact.
- The removed USTs were double-walled, installed in 1992, fitted with alarm systems, and observed to be good condition during removal. It is unlikely a significant fuel release occurred at the Site, and the detected concentrations found in soil samples are the result of minor piping leaks or overspill. This is supported by the rapid attenuation of detected compounds with depth.
- In general, soil excavation procedures were conducted in accordance with Appendix B of the LADPW Guidelines for Report Submittals. Therefore, the former UST farm and adjacent dispensers should be treated as one "source area". Two deep borings at the proposed locations (see attached figure) should complete vertical definition of the residual hydrocarbon impacts at the Site.

- Because no benzene was detected in any soil samples collected during the UST removal and subsequent soil removal action, the focus of the addition assessment should be to assess the vertical extent the residual TPH impacted soil. The proposed scope of work, utilizing sonic drilling methods will increase the probability of reaching the target depths of exploration and collecting the necessary data to complete this evaluation.

If this Addendum and the revised Site map showing proposed boring locations do not sufficiently address the LADPW's concerns regarding the proposed scope of work to complete the Site closure assessment, The Realty Associates Fund and URS would like to schedule a meeting with you and the LADPW Environmental Programs Manager, Mr. Tim Smith, to further discuss any outstanding issues related the Site closure efforts. Please contact me directly at (714) 648 - 2793 if you have any questions or comments.

RE: **Closure Assessment Work Plan Addendum**
Former Hughes Family Market
5305 Rivergrade Road
Irwindale, CA 91706
DPW Permit Application No. 373090
CUPA No. W819505
For The Realty Associates Fund V, L.P.

Dear Mr. Rodriguez:

The following closure assessment work plan addendum is being submitted on behalf of The Realty Associates Fund V, L.P. for the above listed property (Site). URS submitted a closure assessment work plan dated March 21, 2005 to the County of Los Angeles Department of Public Works, Environmental Programs Division (LADPW) for review. The addendum is being submitted in response to the LADPW's request to expand the proposed scope of work and include additional boring locations. Revisions to the proposed scope of work were discussed on April 12, 2005 during a phone conference that included Mr. Eric Rodriquez of the LADPW, J.S. (Scott) Rowlands of URS Corporation, and Maureen Hill Collins of Haley & Aldrich, Inc.

Mr. Rodriquez has indicated that his primary concern is the level of total petroleum hydrocarbons (TPH) remaining in place. There are no published preliminary remediation goals (PRGs) by the USEPA Region 9 for TPH. However, the residual concentrations of TPH as diesel fuel (TPHd) remaining in soil are several orders of magnitude below the Maximum Soil Screening Levels for Soils Above Drinking Water Aquifers provided in the Interim Site Assessment and Cleanup Guidebook (RWQCB, 1996). Although confirmatory samples obtained after soil excavation indicated that the concentrations of TPH remaining on-site in the UST excavations was "non-detect", and only 11 milligrams per kilogram (mg/kg) in one of five confirmatory samples from the excavation at one of the fuel dispensers (FD1), we have agreed to conduct explorations to confirm the vertical extent of the "contamination".

However, we believe that the eight borings requested by LADPW are not warranted based on the existing data and level of remediation previously conducted. In particular, we believe that the existing data can be used to establish the lateral extent of "contamination". The confirmatory samples obtained from the underground storage tank (UST) excavations and the five samples taken at the base of each remedial excavation confirm that "contamination" has not spread

URS Corporation

Fax: 714.667.7147

laterally. Mr. Rodriquez is quoting the LADPW Guidelines for Report Submittals (Revised June 1993) in substantiating these requirements. However, as discussed below, and because there is a significant amount of data indicating that large scale fuel releases have not occurred at this site and that elevated levels of TPH do not remain on-site, we believe that our proposed scope of work is in line with the LADPW Guidelines. We therefore request that the additional assessment be limited to two exploratory borings.

Background

The former Hughes Family Markets distribution center and warehouse located at 5305 Rivergrade Road in the City of Irwindale, California, operated a gas station to serve the requirements of company vehicles. Hughes Family Markets was sold to the Ralph's Grocery chain and the assets of Hughes Family Markets integrated into the Ralph's system. The warehouse located at Rivergrade Road was surplus to Ralph's operations and was sold to The Realty Associates Fund V, L.P. (owners). The owners did not need an operational gas station on their property for their current needs and to comply with State and County regulations a decision was made to remove the three USTs and related piping and apply for regulatory closure.

Three 12,000-gallon USTs were removed from the Site under a permit from the LADPW on July 23, 2003. Two of the three USTs removed were used to store diesel fuel and one was used to store unleaded gasoline. The USTs were double-walled Plasteel with appropriate alarms, spill containment, and overflow protection devices installed to ensure against spills and leaks from the operating systems. These USTs were reportedly installed in 1992 and were last used in 1997-1998. Leaks from the USTs were not reported during their operational period.

All operations related to the removal of the USTs were conducted in the presence of the inspector from LADPW. The USTs were not damaged or otherwise compromised and there were no signs of leakage from the USTs. In addition, the soil removed from the excavation at the time of the tank removals did not show any discoloration or significant odor. Groundwater was not encountered in any of the excavations. Based on data from surrounding areas the depth to groundwater beneath the Site is estimated to be approximately 200 feet below ground surface (bgs).

Per the requirements of the UST closure permit, soil samples were obtained from beneath the removed USTs, product piping, and fuel dispensers using an excavator and/or backhoe. At the time of the UST removals, six samples and one duplicate sample were collected underneath the former USTs at a depth of 17 feet bgs. Ten samples and one duplicate sample were collected from beneath the former fuel dispensers at 4 feet bgs with the exception of the sample taken beneath the satellite fuel dispenser #1 (SFD1), which was taken at 3 feet bgs. Three samples were collected from selected locations beneath removed product piping at depths of 3 to 5½ feet bgs. In addition the soil removed from the UST excavation was staged on the paved ground

surface. To check the quality of the excavated material two composite samples were taken from the excavated soil stockpile. All soil samples were analyzed for volatile organic compounds (VOCs) and were collected with Encore™ samplers in accordance with the current EPA method 5035 protocol required by the Regional Water Quality Control Board, Los Angeles Region (RWQCB).

The soil samples were analyzed in a fixed laboratory for TPH as gasoline (TPHg) and TPHd, by EPA Method 8015M, and for volatile fuel constituents benzene, toluene, ethylbenzene, total xylenes (BTEX) and fuel oxygenates Methyl tert-Butyl Ether (MTBE), Di-isopropyl Ether (DIPE), Ethyl tert-butyl Ether (ETBE), tert-Amyl Methyl Ether (TAME) and tert-Butanol (TBA) by EPA Method 8260B.

BTEX, DIPE, ETBE, TAME, and TBA, were not detected at or above laboratory reporting limits in any of the soil samples collected, excluding one sample from fuel dispenser 5 (FD5) which contained 0.003 mg/kg of toluene. MTBE was detected in soil samples at concentrations ranging from 0.014 to 0.071 mg/kg at locations under fuel dispenser 5 and the UST T1 excavation respectively. TPHg was detected in three soil samples at concentrations ranging from 1 mg/kg to 305 mg/kg. TPHd was detected in six soil samples at concentrations ranging from 10 mg/kg to 6,340 mg/kg.

Following a review of the laboratory analytical results, it was decided to excavate the areas showing signs of petroleum hydrocarbon impacts based on laboratory data. The next round of excavation for impacted soil was conducted on August 27, 2003 in the area of fuel dispensers 1 and 2 (FD1 and FD2), satellite fuel dispensers 2 and 3 (SFD2 and SFD3), and UST T2. The objective of this operation was to remove accessible soil affected with petroleum hydrocarbons prior to backfilling and repaving the former UST and fuel dispensing area. Soil was removed to a depth of several feet below the previous soil sampling locations. Specifically, the soil beneath FD1 and FD2 was removed to a depth of approximately 9½ feet bgs. Soil beneath SFD 2 was removed to depth of approximately 9½ feet bgs. Soil beneath SFD 3 was removed to a depth of approximately 8 feet bgs. Soil beneath removed UST T2 was removed to a depth of approximately 21 feet bgs. Following this round of excavation confirmation soil samples were collected from the bottom and sides of the excavation to verify soil conditions. All soil sampling were conducted per RWQCB protocols.

A review of laboratory analytical results for soil samples collected August 27, 2003 indicated further excavation was required in selected areas. This led to an additional several feet of soil being removed from the areas of FD 1 and FD 2 on September 28, 2003. Additional soil was removed from the bottom of the excavation to a depth of approximately 11 feet bgs.

A total of 21 confirmation samples were collected from the remedial excavations to confirm that impacted soil was removed from the targeted locations. Five samples were collected in the

vicinity of the former UST T2 and 16 samples were collected from beneath the former fuel dispensers at various depths.

Approximately 47 tons of petroleum hydrocarbon affected soil excavated from the areas of the UST T2 and fuel dispensers 1 and 2 and satellite fuel dispensers 2 and 3 was transported to Thermal Remediation Solutions in Azusa, California for disposal/recycling.

Confirmatory sampling provided the following results: BTEX and MTBE were not detected at or above laboratory reporting limits in any of the soil samples collected, excluding one sample from beneath UST T2 which contained 0.021 mg/kg of MTBE. However, this sample was re-analyzed for MTBE by EPA method 8260B and the MTBE detection was not confirmed and therefore is not considered valid. TPHg was detected in one soil sample collected beneath fuel dispensers 1 and 2 at concentration of 2.3 mg/kg. TPHd was detected in soil samples at concentrations ranging from 11 mg/kg to 481 mg/kg. It should be noted that additional soil was excavated in the area of the 481 mg/kg detection, and a second confirmation sample collected from this location yielded a non-detect concentration of TPHd.

Confirmation samples collected from the excavations indicate the residual concentrations of TPHd remaining in soil do not exceed 15 mg/kg. Residual concentrations of toluene remaining in soil do not exceed 0.003 mg/kg. Residual concentrations of MTBE remaining in soil do not exceed 0.071 mg/kg. During the field work it was decided that the residual concentrations were not high enough to warrant further excavation, especially when the excavation was caving in and undermining the concrete slab adjacent to the excavation.

The residual concentrations of toluene detected in soil are below USEPA Preliminary Remediation Goals (PRGs). There are no published PRGs for TPH. However, the residual concentrations of TPHd remaining in soil are several orders of magnitude below the Maximum Soil Screening Levels for Soils Above Drinking Water Aquifers provided in the Interim Site Assessment and Cleanup Guidebook (RWQCB, 1996). The published soil screening levels for TPH have since been rescinded but are still observed by multiple oversight agencies.

Because of its potential effects on groundwater quality, MTBE was further evaluated. The residual concentrations of MTBE detected in soil are below USEPA PRGs and above California Drinking Water Maximum Contaminant Levels (MCLs). Based on field observations, the MTBE detections were rapidly decreasing with depth and the residual concentrations left is place are likely below detectable concentrations well before 50 feet bgs. In, addition, the residual concentrations of TPH and toluene remaining in soil are at low levels and were rapidly decreasing with depth.

Additional Assessment

The LADPW has requested that multiple borings (8) be drilled in the area of the removed USTs to determine the lateral and vertical extent of petroleum hydrocarbon impacts. This request appears to be based on Section VI, Item C of LADPW Guidelines for Report Submittals (Revised June 1993) that states "Generally, a minimum number of borings is required for each tank or tank cluster as indicated below....four borings around a double or triple tank cluster." However, Appendix B-Excavation Procedures of the guidelines indicates that "at minimum, one boring must be drilled per source area, if borings were not performed beforehand to fully define the plume." Based on the post-excavation confirmatory data indicating "non-detect" TPH remaining in place, we do not believe there is a hydrocarbon "plume" beneath the site. However, we are willing to conduct additional exploration to assess the vertical extent of residual TPH impact.

It is requested that the LADPW consider the following points in support of limiting the proposed scope of work to two sonic borings (one boring in the location of removed UST T2, and one boring in the area of removed dispensers FD1/FD2 and SFD2):

- Realty Associates Advisors has agreed to remove the canopy at the Site so as to facilitate drilling in the former area of fuel dispensers FD1/FD2 and SFD2.
- The Site geology is comprised of coarse grained material such as sands and gravels. Contaminant plumes in these types of materials are going to migrate primarily in a vertical fashion (typically in the shape of an inverted cone) and have limited lateral spread.
- Soil sampling data collected during the UST removals and subsequent soil removal actions adequately defined the lateral limits of impact.
- The removed USTs were double-walled, installed in 1992, fitted with alarm systems, and observed to be good condition during removal. It is unlikely a significant fuel release occurred at the Site, and the detected concentrations found in soil samples are the result of minor piping leaks or overspill. This is supported by the rapid attenuation of detected compounds with depth.
- In general, soil excavation procedures were conducted in accordance with Appendix B of the LADPW Guidelines for Report Submittals. Therefore, the former UST farm and adjacent dispensers should be treated as one "source area". Two deep borings at the proposed locations (see attached figure) should complete vertical definition of the residual hydrocarbon impacts at the Site.

- Because no benzene was detected in any soil samples collected during the UST removal and subsequent soil removal action, the focus of the addition assessment should be to assess the vertical extent the residual TPH impacted soil. The proposed scope of work, utilizing sonic drilling methods will increase the probability of reaching the target depths of exploration and collecting the necessary data to complete this evaluation.

If this Addendum and the revised Site map showing proposed boring locations do not sufficiently address the LADPW's concerns regarding the proposed scope of work to complete the Site closure assessment, The Realty Associates Fund and URS would like to schedule a meeting with you and the LADPW Environmental Programs Manager, Mr. Tim Smith, to further discuss any outstanding issues related the Site closure efforts. Please contact me directly at (714) 648 - 2793 if you have any questions or comments.

Subject: Site Assessment Work Plan for 5305 Rivergrade Road, Irwindale

Dear Mr. Rowlands:

The site assessment work plan for the subject site is inadequate. The following information/modifications are requested:

- Health and Safety Plan
- Statement that soil will be analyzed for ethanol using method 8260B, in addition to TPH-G, TPH-D, and the Fuel Oxygenates already stated in the work plan
- Ten borings must be included in the work plan at the following locations (see figure 2 of work plan dated 3/21/05)
    - For vertical definition
        - T2A-17
        - T1A-17
        - FD6
        - FD2
        - SFD2
        - SFD3
    - For horizontal definition, the following boring locations will be accepted
        - 1 boring, located between T2A-17, T1A-17, FD6, SFD2
        - 1 boring, between and 10 feet east of SFD2 and FD2
        - 1 boring, between FD2 and SFD3
        - 1 boring, 10 feet northwest of SFD3
- Specify the depths, depths where sampling will begin and end, and the sampling interval for each boring

The borings at T1A-17 and FD6 are required due to the detection of MTBE in the initial site assessment. Notwithstanding the limited excavation done on the site, definition of the vertical and horizontal extent of contamination is required according to Appendix B on page 30 of the County's "Guidelines for Report Submittals", which states that the extent of contamination must be defined prior to excavation.

Your work plan has been reviewed and these requests are concurred by my supervisor Ms. Rani Iyer, whom Mr. Tim Smith has permitted to make decisions on these matters.

If you have any questions, please call me at 626-458-3513.

Subject: RE: 14005 LIVE OAK AVE IRWINDALE CA 91706

Anna,

You may waive the penalty fees. This file has been transferred to another file. The site address was 14005 Live Oak Ave. Now the site address is 5305 Rivergrade Rd, Permit #373088. The mailing address for the new site is: WOHL Property Group, 30200 Rancho Viejo Rd #C, San Juan Capistrano CA 92675. My understanding is the property is being handled by The Realty Associates Fund(also File name) property is large and has different streets on different sides of the property. Anyway, the other permit is P#6298t is now closed and has a zero balance.

Thanks, Judy

UNDERGROUND STORAGE TANK
CLOSURE INFORMATION

1. This application is for authorization to temporarily or permanently close an underground storage tank (UST) pursuant to Los Angeles County Code, Title 11, Division 4, and California Code of Regulations, Title 23, Division 3, Chapter 16. This application may also be used for product piping removal associated with an existing or removed UST.

2. This application will not be approved unless a valid Hazardous Material Underground Storage Permit (HMUSP) or Unified Program (UP) Permit application is on file with the Department of Public Works (DPW). HMUSP registration fees may be waived, if the DPW finds that the subject USTs' : a. Have been continuously empty and out of service since January 1, 1984; b. The owner or operator was never informed by DPW or any other agency of need to properly close UST's.

2A. Additional fees may be imposed for closure of UST's that were not in compliance with December 22, 1998, standards for upgrade or temporary closure.

3. USTs closed on site by removal or cleaning and filling with an inert solid material prior to January 1, 1984, need not comply with current closure requirements, however, leaks from such USTs must be reported and cleaned up.

4. This application must be accompanied by a UP UST's FACILITY form for each site and UP UST's TANK PAGE 1 and PAGE 2 forms for each UST to be removed or closed.

5. All work shall be carried out in full compliance with all applicable Federal, State and local laws, ordinances, rules and regulations.

6. All fees due to DPW and/or to the Certified Unified Program Agency (CUPA) for the operation and/or maintenance of the facility subject to closure through the date of closure shall be paid.

7. All inspections notification(s) shall be made as directed by the attached conditions of this approval.

8. Within 30 days of the date of closure, the applicant shall furnish to the DPW a closure report describing all work completed, results of any required sampling, disposition of any contaminated soils or materials found and all other requirement made part of the closure application.

9. In all cases, closure permits expire 180 days from the date of issue unless otherwise specified. It is the responsibility of the owner to make sure that the final report contains the required information and is submitted to the DPW within one month from the sampling date or 180 days from the date of the permit issuance, whichever is earlier. The total number of tanks listed on the HMUSP or UP Permit and the yearly annual permit maintenance billing will remain unchanged until the closure report is received by the DPW. Only one copy of the closure report needs to be submitted unless otherwise directed.

10. All closure applications are site specific and may be subject to additional sampling and site characterization requirements as necessary to protect the public health and safety, underground and surface water supplies, and may include requirements, requested by Federal, State or other regulatory agencies.

CLOSURE -- UNDERGROUND STORAGE TANKS

CONDITIONS A -- GENERAL

1. Closures shall be carried out such that all applicable regulations from the following agencies are complied with: Los Angeles County, Department of County Engineer - Facilities; Los Angeles County Fire Department, Fire Prevention Division or the appropriate City Fire Department; South Coast Air Quality Management District; and Los Angeles County Department of Health Services.

2. The County Engineer and Fire Departments shall be notified in advance of any closure in accordance with the following:

   a. Removal of tank shall require a three (3) business day advance notification.

   b. Permanent closure of a tank in place or a temporary closure shall require a 30 day written notification.

3. Consult current fee schedule for costs.

4. All abandoned wells shall be destroyed in such a way that they will not produce water or act as a channel for interchange of water, when such interchange may result in deterioration of the quality of water in any or all water bearing formations penetrated, or present a hazard to the safety and well-being of people and animals.

5. A well destruction permit issued by the Los Angeles Department of Health Services shall be required for all wells requiring a permit for their initial construction.

6. Well destruction shall be accomplished according to methods described in the latest "Water Well Standards: State of California" by the Department of Water Resources, contained in Bulletin 74-81, December 1981, or any other methods that will provide equivalent or better protection.

7. Plans for the decontamination of a facility shall be submitted to the County Engineer for approval no later than 30 days before the commencement of such operations. Other agencies having jurisdiction shall also be notified. These agencies include the California Regional Water Quality Board, the Los Angeles County Department of Health Services, and the South Coast Air Quality Management District.

8. Decontamination shall require the following, as a minimum:

   a. Cleaning operation shall be done under the supervision of persons who understand the hazardous potential of the original liquid stored and its components.

   b. The personnel shall be sufficiently skilled to safely carry out such operation.

   c. Contaminated materials removed from such facility shall be disposed of at legal point of discharge.

   d. The operation shall be carried out in a manner that will not endanger the health of the public and the environment.

CONDITIONS B -- TEMPORARY

1. All temporary closures shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, "Abandonment or Removal of Underground Tanks," Part A and any other applicable Parts.

2. A temporary closure shall not exceed 180 days.

CONDITIONS C -- PERMANENT TANK(S) REMOVAL

1. All tank removals shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Part D and any other applicable Parts.

2. Owners/operators shall notify the Building Department having jurisdiction at the place of removal if a grading permit is necessary.

3. Removed tanks shall not be transported away from the site until an inspection to establish site integrity is carried by the County Engineer.

4. If an appointment has been arranged with a County Engineer Inspector to inspect the removal of a tank, the inspector will only wait at the site a reasonable amount of time (approximately one hour) after arriving for the removal to commence. Another closure fee may be charged if the inspector has to return to the site.

5. After inspection, tanks shall be transported to a legal disposal point.

6. If the tank has stored materials other than motor fuel, fuel oil or waste oil, site integrity shall be demonstrated using the soil sampling and analysis procedures described in CONDITIONS D below.

7. The site shall be backfilled and recompacted to a relative compaction of 90%.

CONDITIONS D -- PERMANENT

1. All permanent closures of tanks in place shall comply with Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Parts B or C, and any other applicable Parts.

2. Owners/operators shall demonstrate part site integrity as follows:

   a. Test borings shall be slant drilled to intercept a point beneath the center of the tank, if possible. If slant drilling is not feasible, the test borings may be drilled vertically and the reason stated in the report in 2.h. below.

   b. For single tanks, a minimum of two test borings will be required, each located on opposite sides of the tank along the major axis of the tank.

   c. For multiple tanks, as a minimum, borings shall be placed at 20 foot intervals around the tank cluster. The actual number and location of borings shall be evaluated on a case-by-case basis. Tanks separated by 20 feet or more shall be considered single tanks for the purposes of test location and placement.

   d. Soil samples shall be taken at depths of 5, 10, 20, 30 and 40 feet below grade level.

   e. A Shelby Tube or a Modified California Sampler shall be utilized for taking all soil samples.

   f. Soil samples shall be capped immediately with teflon or aluminum.

   g. Soil samples shall not be extruded in the field but are to be immediately placed in a refrigerated ice chest and transported to a state certified laboratory for analysis, using suitable methods.

   h. A report containing the results of the above analysis shall be submitted to the County Engineer.

3. If the soil analysis in 2. above indicates the presence of contaminants, the County Engineer shall require a site investigation as described in Chapter V of the County's "Underground Storage of Hazardous Materials -- Guidelines."

4. A report shall be submitted to the County Engineer containing the results of the site investigation.

DEPARTMENT OF PUBLIC WORKS
CLOSURE PERMIT
SOIL SAMPLING REQUIREMENTS FOR TANK REMOVALS
VOLATILE, SEMI-VOLATILE AND EXTREMELY HAZARDOUS MATERIALS

These requirements are in addition to those specified on the Closure Permit or supplemental forms.

Site integrity shall be demonstrated as indicated below prior to tank removals where the tank presently or previously contained either 1) a volatile or semi-volatile priority pollutant as defined by the Federal Register, Vol. 44, No. 233, December 3, 1979, (Revised 1981), or 2) any material which, as a waste, would be considered an extremely hazardous waste as defined by Title 22, California Administrative Code, Section 66680.

It is the Owners/operators responsibility to insure tanks are not excavated until site integrity has been determined and that all applicable safety measures are taken to protect all personnel at the removal site from exposure to hazardous materials. Owners/operators shall demonstrate site integrity as follows:

1. Test borings shall be slant drilled to intercept a point beneath the center of the tank, if possible. If slant drilling is not feasible, the test borings may be drilled vertically and the reason stated in the closure report.

2. For single tanks, a minimum of two test borings will be required, each located on opposite sides of both the major and the minor axis of the tank. The borings shall be as close as practicable to the tank.

3. For multiple tanks, as a minimum, borings shall be placed at 20 foot intervals around the tank cluster. The actual number and location of borings shall be evaluated on a case-by-case basis. Tanks separated by 20 feet or more shall be considered single tanks for the purpose of boring location and placement.

4. Samples shall be obtained under the direct supervision of a California Certified Engineering Geologist, California Registered Geologist or California Registered Civil Engineer with sufficient experience in soils.

5. Soil samples shall be obtained at depths of 5, 10, 20, 30 and 40 feet below grade level.

6. A Shelby Tube or a Modified California Sampler shall be utilized for obtaining all soil samples.

7. Soil samples shall be capped immediately with teflon or aluminum foil.

8. Soil samples shall not be extruded in the field but are to be immediately placed in a refrigerated ice chest and transported to a State certified laboratory for analysis, using suitable methods.

9. If groundwater is encountered during sampling, a groundwater monitoring well shall be established at the most downgradient sampling point. The well shall be properly developed and a groundwater sample shall be obtained. and analyzed.

10. All soil samples obtained shall be discrete, undisturbed, sealed and unexposed prior to analysis. The method used to obtain the samples and the date of sampling shall be included in the final report. Samples submitted for laboratory analysis are not to be used for field screening.

DEPARTMENT OF PUBLIC WORKS
CLOSURE PERMIT
SOIL SAMPLING REQUIREMENTS FOR TANK REMOVALS
VOLATILE, SEMI-VOLATILE AND EXTREMELY HAZARDOUS MATERIALS

11. The analytical results for all soil samples shall be expressed milligrams per kilogram (mg/kg), or micrograms per kilogram (ug/kg) as appropriate. Practical quantitation limits of 5-10 ug/kg (ppb) for volatile organics and 1 mg/kg (ppm) for the petroleum hydrocarbons must be achieved by the laboratory. Analytical results for groundwater samples shall be expressed in ug/l (ppb) and practical quantitation limits of .5-5ug/l (ppb) for volatile organics, and 1 mg/l (ppm) for petroleum hydrocarbons must be achieved by the laboratory.

12. Analytical results shall be reported on laboratory letterhead and shall include the following information: a) The date the analysis was conducted; b) The method of extraction (if applicable); c) Detection limits for each analytical procedure and determination; d) The method of analysis; e) Signature of chemist certifying results.

13. All soil/groundwater samples obtained shall be handled and transported to laboratory in strict accordance with applicable EPA regulations utilizing chain-of-custody procedures. Chain-of-Custody documentation shall be included in the final report.

Owners/operators can also demonstrate site integrity in the field using an organic vapor analyzer for head space analysis of soil samples obtained at boring and sampling locations and depths specified above. Alternative field demonstration methods may be acceptable if approved by this Department in advance. Field demonstrations shall not be substituted for the requirement of laboratory analysis.

Either the laboratory analytical results of soil/groundwater samples or the field demonstration results must be available to tank removal field personnel and this Department's inspector at the time the tank is removed.

Owners/operators must report the detection of an unauthorized release to this Department within 24 hours. If contamination is inadvertently found during excavation, backfill immediately and report the finding to this Department within 24 hours. If contamination is indicated by laboratory analysis or found in the field, a site characterization will be required.

UST1/CL205B 7/90

NOTICE TO CLOSURE PERMIT APPLICANTS

The South Coast Air Quality Management District (SCAQMD) has adopted Rule 1166 regulating emissions of Volatile Organic Compounds (VOC) from decontamination of soil effective **August 5, 1988.**

In addition to the requirements of your Closure Permit, persons excavating any underground storage tank that previously contained VOC's must:

- Notify the SCAQMD by telephone at (909) 396-2326 or by fax at (909) 396-3342 using the SCAQMD notification form 24 hours prior to tank excavation. 1166(c)(1)(A)
- Monitor the excavated material during the excavation for VOC contamination. 1166(c)(1)(B)
- When VOC contamination is detected:
  - Cease excavation.
  - Cover the contaminated soil until implementation of approved mitigation measures. 1166(c)(1)(C)
  - Notify the SCAQMD at (909) 396-2326 within 24 hours of detection of VOC contaminated soil. 1166(c)(2)(A)
- A person shall not engage in or allow any on-site or off-site spreading of VOC contaminated soil which results in uncontrolled evaporation of VOC to the atmosphere. 1166(c)(3)

Exemptions

- Treatment of less than one (1) cubic yard of contaminated soil. 1166(d)(1)(A)
- Decontamination of soil containing organic compounds that have initial boiling point of 302°F or greater, Reid Vapor Pressure less than 80mm Hg or Absolute Vapor Pressure less than 36mm Hg at 20°C. 1166(d)(1)(B),(F)
- Removal of soil for sampling purposes pursuant to EPA methods. 1166(d)(1)(C)
- Accidental spillage of five (5) gallons or less of VOC. 1166(d)(1)(D)
- Documentation of soil which is contaminated through natural seepage of VOC from oil and gas wells or other natural sources. 1166(d)(1)(E)

SPECIFIC QUESTIONS ON RULE 1166 SHOULD BE REFERRED TO THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (909) 396-2326

900 S. FREMONT AVENUE
ALHAMBRA, CA 91803

Closure Permit
No.: 373090 B
File No.
I- 15636 38592

PART 1 OF 2

To satisfy the permanent closure requirements for underground storage tanks previously storing hazardous materials, site integrity must be demonstrated by the analysis of soil samples and, if applicable, groundwater samples as outlined below. These requirements are in addition to the conditions listed on the Application for Closure or contained in an approved Closure Plan.

1. Samples shall be obtained at the sampling points (SP) indicated on the attached plot plan.

2. For each SP, samples shall be obtained at the following depths:

SP	Depth(s)	Compounds	Analysis Method
1A, 1B	2-4 ft below	TPH(G)	8015 (M)
2A, 2B	tank invert	BTEX, MTBE	8260 B
3A, 3B		Fuel Oxygenates	
1 sample	2-4 ft below	"	"
	every 20ft of piping	"	"
	Starting at dispenser		
1 sample	2-4 ft below	"	"
	each dispenser	"	"

EPA Method 5035 shall be used for soil Sample collection, preparation and preservation

Cont'd on Page 2

3. All soil samples obtained shall be discrete, undisturbed and unexposed prior to analysis. The method used to obtain the samples and the date of sampling shall be included in the final report.

4. If groundwater is encountered during sampling, a groundwater monitoring well shall be established at the most downgradient sampling point. The well shall be developed by removing a minimum of four well volumes and a groundwater sample shall be obtained and analyzed.

5. The analytical results for all soil samples shall be expressed milligrams per kilogram (mg/kg), or micrograms per kilogram (ug/kg) as appropriate. Practical quantitation limits of 5-10 ug/kg (ppb) for volatile organics and 1 mg/kg (ppm) for the petroleum hydrocarbons must be achieved by the laboratory. Analytical results for groundwater samples shall be expressed in ug/l (ppb) and practical quantitation limits of .5-5 ug/l (ppb) for volatile organics, and 1 mg/l (ppm) for petroleum hydrocarbons must be achieved by the laboratory. Use Detection Limits set forth by the California Regional Water Quality Control Board

6. Analytical results shall be reported on laboratory letterhead and shall include the following information: a) The date the analysis was conducted; b) The method of extraction (if applicable); c) Detection limits for each analytical procedure and determiantion; d) The method of analysis; e) Signature of chemist certifying results.

7. All soil/groundwater samples obtained shall be handled and transported to laboratory in strict accordance with applicable EPA regulations utilizing chain-of-custody procedures. Chain-of-custody documentation shall be included in the final report.

8. If the soil/groundwater analysis indicates undefined contamination at the facility, additional sampling shall be required to define the vertical and lateral extent present.

9. A final report that contains all of the above required information shall be submitted to the office above within one (1) month from the sampling date or 180 days from the date of this permit, whichever is earlier.

dn4/FPERMIT Rev. 3/90

ATTENTION CONTRACTOR

NOTIFICATION/PERMIT REQUIREMENTS

This Closure Authorization is issued subject to compliance with all applicable laws and regulations relating to the performance of work including, but not limited to, business license requirements, Building Codes, Fire Codes, Air Quality regulations, Health and Safety Codes, Water Codes, and Transportation regulations.

Pursuant to Los Angeles County Code, Section 11.78.045, and the Conditions and Limitations of the attached Hazardous Materials Underground Storage Closure Authorization, you are required to complete **ALL** of the agency notifications indicated below within the time period specified prior to commencement of work on this closure.

[X] 72 HOURS - DEPARTMENT OF PUBLIC WORKS WASTE CONTROL ENGINEERING INSPECTOR:

>>>Unless otherwise noted DPW inspectors are available at the following offices, Monday through Friday, between 8 a.m. and 9:30 a.m. **ONLY**.<<<

Article 12. Electronic Submission of Laboratory Data for UST Reports

§2729. Definitions.

"COELT" is the Corps of Engineers Loading Tool program. It is a relational database application that is designed to run with the Microsoft Windows operating system. COELT places laboratory data into the standardized Electronic Deliverable Format (EDF). The program can accept Laboratory Information Management System (LIMS) data or manually entered data. COELT is intended to help the user enter data, find errors, and comply with the laboratory data requirements of the EDF data deliverable. COELT includes a report utility that allows hard copy laboratory reports to be printed that match the actual electronic data. For purposes of the requirements of this article, version 1.2a of COELT may be used. Programs (coelt.zip and coeltservicepack.zip) and documents (coeltmanual.zip and coeltsupplement12a.zip) for the version 1.2a of COELT are available at http://www.swrcb.ca.gov or from SWRCB at 1001 I Street, Sacramento, CA 95814.

"EDCC" means the Electronic Deliverable Consistency Checker program, which was developed for the Corps of Engineers. The EDCC program is run upon completion of an EDF report to produce an error report. This error report identifies problems within the given data set based upon the EDF database structure, guidelines and restrictions, and valid values. The error report also indicates the nature of each problem, so that the laboratory can correct it. For purposes of the requirements of this article, version 1.2a of EDCC shall be used. Programs (edcc.zip and edccservicepac1.zip) for the version 1.2a of EDCC are available at http://www.swrcb.ca.gov or from SWRCB at 1001 I Street, Sacramento, CA 95814.

"EDF" means the Electronic Deliverable Format that was developed for the United States Army Corps of Engineers. It is a data standard designed to facilitate the transfer of electronic data files from analytical laboratories to end-users. It is a relational database consisting of five files, related to one another through key fields. Laboratories can produce electronic documents in EDF using the COELT software or with other programs outside of COELT. The data components include the chain-of custody information, laboratory results, and quality assurance information. For purposes of the requirements of this article, version 1.2i of EDF shall be used. Specifications for version 1.2i of EDF (The Electronic Deliverable Format [EDF] Version 1.2i Guidelines & Restrictions dated April 2001 and Data Dictionary dated April 2001) are available at http://www.swrcb.ca.gov or from SWRCB at 1001 I Street, Sacramento, CA 95814.

"Report" means any document or item that is required for submission in order for a person to comply with a regulation, directive, or order issued by the state board, a regional board, or a local agency pursuant to a program administered by the state board, including but not limited to, any analysis of material by a laboratory that has accreditation or certification pursuant to Article 3 (commencing with Section 100825) of Chapter 4 of Part 1 of Division 101 of the Health and Safety Code.

Authority cited: Section 13197.5, Water Code.
Reference: Section 13195(b), Water Code

Article 12. Electronic Submission of Laboratory Data for UST Reports

§2729.1. Electronic Submission of Laboratory Reports.

(a) If a report required to be submitted to the state board, a regional board, or a local agency pursuant to Chapter 6.7 (commencing with Section 25280) of Division 20 of the Health and Safety Code or Article 4 (commencing with Section 25299.36) of Chapter 6.75 of Division 20 of the Health and Safety Code contains laboratory data reporting soil or water chemistry analysis, such data shall also be submitted to the SWRCB Geographic Environmental Information Management System database using the EDF.

(b) Beginning January 1, 2002, any person submitting laboratory data in electronic format pursuant to these regulations shall specify for the location where the analyzed sample was collected: 1) the latitude and longitude of groundwater monitoring wells accurate to within one meter, and 2) the surveyed elevation relative to mean sea level of any groundwater monitoring well sampled.

(c) All data shall be checked for errors prior to submittal, using the EDCC software consistency checking tool. Electronic submittal of laboratory data over the Internet shall be in addition to hard-copy laboratory reports generated by either COELT or other laboratory software.

(d) Electronic submission of data generated by analysis of soil or water samples shall be required beginning on September 1, 2001.

Authority cited: Section 13197.5, Water Code.
Reference: Sections 13196(a), 13197.5(a), (c) and (d)(2), Water Code.

LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS
BUILDING AND SAFETY DIVISION

TO: APPLICANTS FOR THE REMOVAL OF UNDERGROUND STORAGE TANKS

When an underground storage tank is removed in the unincorporated area of Los Angeles County or one of the incorporated Cities where the County serves as the Building Official, a building permit (demolition permit) must be obtained before the tank is removed. The permit is issued by the County or City field office having jurisdiction over the area where the tank is located. A list of the field offices is attached for your reference.

To ensure that an over-the-counter permit can be issued, please bring the following to the appropriate County or City field office:

1. A copy of the closure permit issued by Waste Management Division.

2. A copy of the tank removal permit issued by the Fire Department.

3. A Certificate of Worker's Compensation Insurance addressed to the appropriate field office.

4. Permit and processing fees. Please call the office having jurisdiction for fee amounts if needed.

5. A plot plan showing the area of excavation and any structures on the site. Indicate whether or not the backfill will be compacted under the supervision of a Soils Engineer. (Some jurisdictions require the backfill to be compacted. If you are planning on placing uncompacted fill, check with the office having jurisdiction.)

Please be aware that a City business license may be required if the job is located in an incorporated City.

DIRECTORY OF THE COUNTY OF LOS ANGELES AND CONTRACT CITY BUILDING AND SAFETY OFFICES

Unless specifically indicated, all field offices are open 8 a.m. to 4:30 p.m., Monday through Friday, except legal Holidays*

COUNTY OF LOS ANGELES DEPARTMENT OF PUBLIC WORKS
ENVIRONMENTAL PROGRAMS DIVISION

CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the County of Los Angeles Department of Public Works, Environmental Programs Division, P.O. Box 1460, Alhambra, California 91802-1460, containing:

1. File number of facility and closure permit number.

2. Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets, and north arrow.

3. Description of methods for obtaining, handling, and transporting samples.

4. Time and date samples were obtained.

5. Soil sampling certification (including but not limited to soils classification, boring logs, sample procedures, sample locations, initiating chain-of-custody, and groundwater location) for UST closure shall be certified by a California registered geologist, a California certified engineering geologist, or a California registered civil engineer with sufficient experience in soils. The certification must clearly state that all work was performed under the supervision of the person signing.

6. Chain-of-custody documentation initiated by person obtaining sample through person at a California Department of Health Services certified laboratory.

7. Disposal destination of tanks and evidence of legal disposal.

8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction, and methods of analysis.

9. Documentation as to depth of groundwater at facility.

10. Manifests to document hazardous waste disposal of any removed soil and tank rinsate.

11. Evidence of legal disposal of soils designated as nonhazardous.

12. Any observations of site contamination.

13. Remedial action plan to mitigate contamination.

14. Report to be signed by a California registered geologist, a California certified engineering geologist, or a California registered civil engineer with sufficient experience in soils.

APPLICATION NO. 3230855 (apso)
FILE NO. 15636-35522 R/C 35
DATE REC'D. 3/20/03 BY RLG

Pursuant to Los Angeles County Code, Title 11, Division 4, Section 11.80.170 and California Health and Safety Code, Division 20, Chapter 6.7, Section 25284 (c), application is hereby made for transfer of an existing Hazardous Materials Underground Storage Permit (HMUSP) to a new tank owner.

COMPLETE THE FOLLOWING:

New Facility Name THE REALTY ASSOCIATES FUND V LP.

Existing HMUSP or Unified Program (UP) Permit No. (If known) _____ Number of Tanks 3

Facility Address 5305 RIVERGRADE Rd. City Irwindale.

New Permittee (permit) _____

THE NEW PERMITTEE IS:

- ☒ Tank Owner and Operator - Fee Required
- ☐ Tank Owner Only - Fee Required
- ☐ Unified Program facility owner and operator (complete below) - Fee required
- ☐ Unified Program facility owner only - Fee required

IF OPERATOR IS NOT THE OWNER, AND IS NOT NAMED ON THE UNIFIED PROGRAM (UP) FACILITY PERMIT, COMPLETE THE FOLLOWING:

Tank Operator Name _____ Telephone ( ) _____

Tank Operator Address _____ State _____ Zip _____

No fee required to notify of operator change if that person is not replacing a person named in the Unified Program Permit.

This Application for Transfer must be accompanied by a completed and signed UP Facility form, or UP Tank Page 1 and Tank Page 2 forms, for each tank to be transferred.

APPLICATION FOR TRANSFER FEE **$213.00** ( ) CASH ( ) CHECK # _____

BY SIGNATURE BELOW; THE PERMIT TRANSFER APPLICANT ACKNOWLEDGES HAVING READ ALL CONDITIONS FOR TRANSFER ON THE REVERSE SIDE OF THIS FORM, AGREES TO COMPLY WITH THE CONDITIONS AND LIMITATIONS OF AND ASSUMES THE OBLIGATIONS OF THE HMUSP PERMIT FOR WHICH TRANSFER IS REQUESTED.

Signature _____ Title OWNER, REP

INSTRUCTIONS

Hazardous Materials Underground Storage Permit (HMUSP)Application Supplement

1. This Application for Transfer form is to be used only for the transfer of an existing HMUSP or underground storage tank authorized under a Unified Program (UP) Permit to a new owner or operator of a facility within the jurisdiction of the County of Los Angeles, Unified Hazardous Materials Program and the Department of Public Works (DPW).

2. The new owner or operator must complete and submit an Application for Transfer to DPW accompanied by a UP Facility form and the Transfer Fee within thirty (30) days of assumption of ownership or commencement of operation.

3. By applying for transfer of an existing HMUSP, the new owner or operator agrees to assume all obligations under the existing HMUSP including all fee installments, installation and maintenance of approved monitoring systems and reporting requirements. IT IS THE APPLICANTS RESPONSIBILITY TO DETERMINE IF DELINQUENT FEES OR SUBMITTALS ARE DUE FOR THE NAMED FACILITY.

4. In lieu of transfer, a new owner or operator may apply for a new HMUSP within thirty (30) days of the assumption of ownership without assuming the prior permittees obligations. Such submittal shall include: a) a completed and signed Department of Public Works Permit Application Supplement, b) UP Facility form, c) UP Tank Page 1 and UP Tank Page 2 forms for each tank, d) appropriate DPW application fee. Verification of safe storage may be required prior to issuing a new HMUSP.

5. The DPW may review and modify, or terminate, the transfer of a HMUSP if it is determined the facility is not providing or threatens not to provide safe storage.

6. The owner or operator of an underground storage facility shall monitor the facility using the method specified in the HMUSP. If the permittee of a facility is not the tank owner or operator, the permittee shall provide a copy of the HMUSP to both the owner and operator. If the permittee is a person other than the operator of the tank, that person shall do all of the following: a) enter into a written contract with the operator which requires the operator to monitor the tank(s) as set forth in the permit, b) provide the operator with a copy of California Health and Safety Code, Section 25299, and c) inform DPW within thirty (30) days of any change of operator.

7. The HMUSP annual maintenance fee will be billed to the tank owner named on the permit unless other specific arrangements have been approved by DPW and Los Angeles County Fire Department. Regardless of billing arrangements, the tank owner is responsible for insuring payment of all fees and compliance with all monitoring requirements.

CERTIFICATION OF COMPLIANCE WITH
LOS ANGELES COUNTY LOBBYIST ORDINANCE

This is to certify that I, as permit applicant, for the project located at Irwindale
LOCATION ADDRESS

am familiar with the requirements of Los Angeles County Code Chapter 2.160 et seq., (relating to the Los Angeles County Lobbyist Ordinance) and all persons acting on behalf of myself have complied and will continue to comply therewith through the application process.

UST - Tank Page 1

Formerly SWRCB Form B

Complete the UST - Tank pages for each tank for all new permits, permit changes, closures and/or any other tank information change. This page must be submitted within 30 days of permit or facility information changes, unless approval is required before making any changes. For compartmentalized tanks, each compartment is considered a separate tank and requires completion of separate tank pages.

Refer to 23 CCR §2711 for state UST information and permit application requirements.

(Note: the numbering of the instructions follows the data element numbers that are on the UPCF pages. These data element numbers are used for electronic submission and are the same as the numbering used in 27 CCR, Appendix C, the Business Section of the Unified Program Data Dictionary.)

Please number all pages of your submittal. This helps your CUPA or local agency identify whether the submittal is complete and if any pages are separated.

1. FACILITY ID NUMBER - Leave this blank. This number is assigned by the CUPA. This is the unique number which identifies your facility.
3. BUSINESS NAME - Enter the full legal name of the business.
430. TYPE OF ACTION - Check the reason the page is being completed. For amended permits and change of information, include a short statement to direct the inspector to the amendment or changed information.
431. LOCATION WITHIN SITE - Enter the location of the tank within the site.
432. TANK ID NUMBER - Enter the owner's tank ID number. This is a unique number used to identify the tank. It may be assigned by the owner or by the CUPA.
433. TANK MANUFACTURER - Enter the name of the company that manufactured the tank.
434. COMPARTMENTALIZED TANK - Check whether or not the tank is compartmentalized. Each compartment is considered a separate tank and requires the completion of separate tank pages.
435. DATE TANK INSTALLED - Enter the year and month the tank was installed.
436. TANK CAPACITY - Enter the tank capacity in gallons.
437. NUMBER OF TANK COMPARTMENTS - If the tank is compartmentalized, enter the number of compartments.
438. ADDITIONAL DESCRIPTION - Use this space for additional tank or location description.
439. TANK USE - Check the substance stored. If MOTOR VEHICLE FUEL, check box 1 and complete item 440, PETROLEUM TYPE.
440. PETROLEUM TYPE - If box 1 is checked in item 439, check the type of fuel.
441. COMMON NAME - For substances that are not motor vehicle fuels (box 1 is NOT checked in item 439), enter the common name of the substance stored in the tank.
442. CAS # - For substances that are not motor vehicle fuels (box 1 is NOT checked in item 439), enter the CAS (Chemical Abstract Service) number. This is the same as the CAS # in item 209 on the Hazardous Materials Inventory - Chemical Description page.
443. TYPE OF TANK - Check the type of tank construction. If type of tank is not listed, check "other" and enter type.
444. TANK MATERIAL (PRIMARY TANK) - Check the construction material of the tank that comes into immediate contact on its inner surface with the hazardous substance being contained. If the tank is lined do not reference the lining material in this item. Indicate the type of lining material in item 446. If type of tank material is not listed, check "other" and enter material.
445. TANK MATERIAL (SECONDARY TANK) - Check the construction material of the tank that provides the level of containment external to, and separate from, the primary containment. If type of tank material is not listed, check "other" and enter material.
446. TANK INTERIOR LINING OR COATING - If applicable, check the construction material of the interior lining or coating of the tank. If type of interior lining or coating is not listed, check "other" and enter type.
447. DATE TANK INTERIOR LINING INSTALLED - If applicable, enter the date the tank interior lining was installed. This is to assist the CUPA to develop an inspection schedule.
448. OTHER TANK CORROSION PROTECTION - If applicable, check the other tank corrosion protection method used. If other corrosion protection method is not listed, check "other" and enter method.
449. DATE TANK CORROSION PROTECTION INSTALLED - If applicable, enter the date the tank corrosion protection method was installed. This is to assist the CUPA to develop an inspection schedule.
450. YEAR SPILL AND OVERFILL INSTALLED - Check the appropriate box and enter the year in which spill containment, drop tube, and/or striker plate was installed. CHECK ALL THAT APPLY.
451. TYPE OF SPILL PROTECTION - Enter the type of spill containment, drop tube, and/or striker plate. FOR CUPA USE ONLY.
452. YEAR OVERFILL PROTECTION EQUIPMENT INSTALLED - Check the appropriate box and enter the year in which overfill protection was installed or whether there is an exemption from overfill protection. CHECK ALL THAT APPLY, unless tank is exempt.
453. TANK LEAK DETECTION (SINGLE WALL) - For single walled tanks, check the leak detection system(s) used to comply with the monitoring requirements for the tank. CHECK ALL THAT APPLY. If leak detection system is not listed, check "other" and enter system.
454. TANK LEAK DETECTION (DOUBLE WALL) - For double walled tanks or tanks with bladder, check the leak detection system(s) used to comply with the monitoring requirements for the tank. CHECK ONE ITEM ONLY.
455. ESTIMATED DATE LAST USED - For closure in place, enter the date the tank was last used.
456. ESTIMATED QUANTITY OF SUBSTANCE REMAINING IN TANK - For closure in place, enter the estimated quantity of hazardous substance remaining in the tank (in gallons).
457. TANK FILLED WITH INERT MATERIAL - For closure in place, check whether or not the tank was filled with an inert material prior to closure.

ATTACHMENTS -

1. Provide a scaled plot plan with the location of the UST system, including buildings and landmarks.
2. Provide a description of the monitoring program.

Site Address 5305 Rivergrade Rd. City, Zip IRWINDALE 91706

Mailing Address 30200 Rancho Viejo Rd. Ste C City, Zip San Juan Capistrano

A recent inspection of your facility revealed the following conditions and/or practices relating to hazardous materials underground storage tanks (USTs) which are violations of California Health and Safety Code (CH&SC) Chapter 6.7; Los Angeles County Code (LACC), Title 11, Division 4 and/or the conditions and limitations of the above permit.

Your Attention is directed to your non-compliance with the Notice issued on: NO FIRST NOTICE
Violation No.: V .

YOU ARE HEREBY DIRECTED to submit to the office indicated below, the following items checked:

☐ ~~OPERATING WITHOUT A COMPLIANCE CERTIFICATE~~

~~YOU ARE HEREBY DIRECTED to submit the following items checked on the attached COMPLIANCE CERTIFICATE CHECKLIST. Please note that the USTs installed prior to 2001 are not required to submit the Secondary Containment Test Results.~~

☒ OPERATING WITHOUT AN OPERATION MONITORING SYSTEM

YOU ARE HEREBY DIRECTED to have the monitoring system and the USTs certified immediately and the results received by this office no later than 2-21-03 or the contents of all underground storage tank systems are to be removed within this time period.

☐ UNREGISTERED TANKS

YOU ARE HEREBY DIRECTED to submit the following items checked on the attached UNREGISTERED TANK CHECKLIST and/or COMPLIANCE CERTIFICATE CHECKLIST

☐ ADDITIONS/MODIFICATIONS TO THE UNDERGROUND STORAGE TANK FACILITY

- ☐ Complete and sign the Application for Modification (green form).*
- ☐ An application fee of $ payable to the County of Los Angeles Department of Public Works.
- ☐ A letter indicating all of the additions/modifications.*
- ☐ Four (4) sets of plans indicating the location of all additions/modification

☒ OPERATING WITHOUT A PERMIT DUE TO A CHANGE OF OWNERSHIP

- ☒ Complete and sign the Transfer of Ownership Application (yellow form).*
- ☒ An application fee of $ TBD payable to the County of Los Angeles Department of Public Works.
- ☒ Complete and sign the Unified Program (UP) Form - Underground Storage Tanks Facility.* (You must include the Board of Equalization Number)
- ☒ Complete and sign the Certificate of Financial Responsibility Form
- ☒ Provide Monitoring System Certification, which is current (performed within the last 12 months).

☒ OUT OF SERVICE UNDERGROUND STORAGE TANKS

Immediately remove all residual liquids, solids, or sludge stored within the USTs to a legal disposal facility.

- ☒ Complete, and sign the Application for Closure.* Temporary
- ☒ An Application for Closure fee of $ TBD payable to the County of Los Angeles Department of Public Works.
- ☐ Complete and sign Permit Application Supplemental/Notice to File.
- ☐ Complete and sign the Unified Program (UP) Form - Underground Storage Tank Facility.* (You must include the Board of Equalization Number)
- ☐ Complete and sign the Unified Program (UP) Form-Tank (Both pages).*
- ☐ An Operating Permit Application fee of $ payable to the County of Los Angeles, Department of Public Works.
- ☐ Submit an Annual Permit Maintenance fee of $ payable to the County of Los Angeles Department of Public Works.

☒ IMMEDIATELY, pump tanks immediately, which will then not require monitor certification
☒ FAILURE to test tanks per SB989, TEST immediately

YOU ARE FURTHER DIRECTED to submit to the office below evidence of compliance with the above directives by no later than fifteen (15) days from the date on this Notice, unless otherwise directed above. Failure to comply with the Underground Storage Tank laws and regulations may subject you to a civil penalty of not less than $500 or more than $5,000, or by one year in county jail or both.

If you have any questions regarding this matter, please contact JOHN NELSON Monday through Friday, 8 a.m. to 9:30 a.m. at ( ) 626-574-0962 FAX 626-446-4425

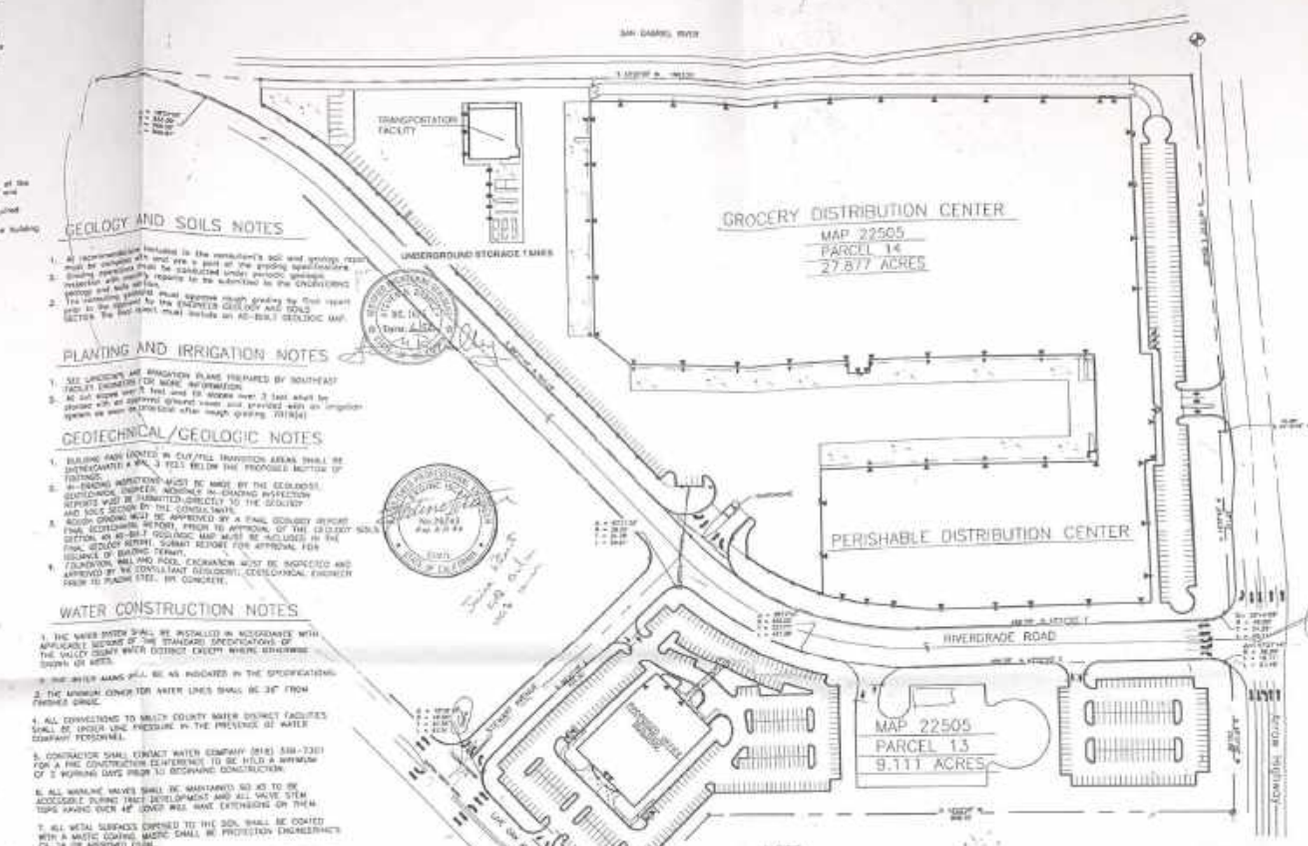
GENERAL GRADING NOTES

1. All work shall be done in accordance with Chapter 70 of the Los Angeles County Building Code, 1980 Edition.
2. Fill shall be compacted throughout their full extent to a minimum of 90% of maximum dry density as determined by ASTM test compaction test #1557-78, method "A", where particular sieve not applicable a test acceptable to the building official shall be used. 7014(b)
3. The Soils Engineer shall provide sufficient inspections during the preparation of the natural ground and the placement and compaction of the fill to be satisfied that the work is being performed in accordance with the plan and applicable code requirements.
4. All vegetation shall be stripped and removed from the site. No fill shall be placed until stripping of vegetation, removal of unsuitable soils and installation of subdrains (if any) have been inspected and approved by the Soils Engineer. Unsuitable material shall be removed from the site at the Contractor's expense.
5. No rock or similar material greater than 12 inches in diameter will be placed in the fill unless recommendations for each placement have been submitted by the Soils Engineer in advance and approved by the Building Official.
6. Sufficient tests of the fill soils shall be made to determine the density thereof:
   a. One test for each two feet of vertical fill.
   b. One test for each 1000 cubic yards of material placed.
   c. One test at the location of the final fill slope for each building site (lot) in each four foot vertical fill or portion thereof.
   d. One test in the vicinity of each building pad for each four-foot vertical fill or portion thereof.

   Sufficient tests of fill soils shall be made to verify compliance of the soil preparation with the design requirements including soil types and shear strengths.
   The results of such testing shall be included in the reports required by chapter 70, 7014(b)(c).
   Field density shall be determined by a method acceptable to the building official. 7014(c)
7. Estimated starting date: 10/30/91
   Estimated completion date: 2/30/92
8. A soil report prepared by PROFESSIONAL SERVICES INC., and any subsequent addendum thereof shall be considered a part of these plans. Work shall be performed in conformance with the recommendations outlined in this report.
9. Contractor shall secure and pay for grading permit prior to commencing any grading work.
10. The permittee or his agent shall notify the Building Official at least one working day in advance of required inspections at following stages of the work:
    a. Initial. When the site has been cleared of vegetation and unsuitable fill soils it has been scarified, benched or otherwise prepared for fill, but no fill shall have been placed prior to this inspection.
    b. Rough. When approximate final elevations have been established, drainage terraces, swales and berms installed at the top of the slopes, and the statements required by Section 87025 have been received.
    c. Final. When grading has been completed, all drainage devices installed, slope planting established, irrigation systems installed, and the as-graded plans and required statements and reports have been submitted.
11. In addition to the inspection required of the Building Official for regular grading, reports and statements shall be submitted to the Building Official in accordance with Sections 87030 and 87031.
12. The plans of a designed irrigation system for full coverage of all portions of the slopes shall be submitted and approved prior to rough grading approval by the County Inspector. Hose bibbs may be used for slopes up to 20 feet high when placed so that all portions of the slopes can be watered with a 125 foot hose; perimeters are required for higher slopes.
13. Continuous inspection by the Soils Engineer or his responsible representative will be provided during all fill placement and compaction operations. (Slopes where fills have a depth greater than 30 feet, or a slope surface steeper than 2:1.)
14. All cut and fill slopes shall be planted with an approved ground cover and provided with an irrigation system as soon as practical after rough grading. In addition to the ground cover planting, shrubs approved by the Fire Department, deep rooted, low volume, drought tolerant plants, shall be planted on all slopes exceeding 15 feet in height. Such shrubs and plants shall be selected which will produce a coverage of permanent planting effectively containing erosion. Information shall be submitted to the Building Official for approval prior to planting showing that consideration was given to deep-rooted plants needing limited water, low maintenance, high resistance to wind, wind susceptibility and fire retardance.
15. Any modifications of or changes in approved grading plans must be approved by the Building Official.
16. A copy of the grading permit must be in the possession of a responsible person and available at the site.
17. Provisions shall be taken for evolutionary drainage at all times.
18. A preventive program to protect the slopes from potential damage from burrowing rodents is required. Owner to inspect slopes periodically for evidence of burrowing rodents and at first evidence of their existence shall employ an exterminator for their removal. 7016(h)
19. All fill material shall be placed in loose layers not to exceed 6 inches in thickness. Each layer shall be brought to optimum moisture content and compacted by means of a sheepfoot tamper or other equipment approved by the Engineer.
20. Any imported fill shall be noncorrosive and approved by the Soils Engineer prior to use in compacted fill areas.
21. Field Engineer must set grade stakes for all drainage devices and inspection shall be obtained before construction.
22. Prior to issuance of building permits, the Soils Engineer shall submit a report on the expansive properties of soils as such soils are defined by Building Code Section 2904(f) that are located within the building area.
23. Maximum cut and fill slopes shall be 2:1.
24. The existing topography as delineated on these plans shall be utilized as the basis for all earthwork computations. Said topography shall be presumed to be correct as to interrelated portions unless a deviation is found prior to the start of grading in any specific areas. Any deviation as determined shall be transmitted to all interested parties promptly.
25. Permission shall be secured from the County of Los Angeles, City of Irwindale and U.S. Army Corps of Engineers for construction, grading and/or discharge of drainage structures within right-of-way.
26. Roof drainage shall be diverted away from all graded slopes.
27. Finish grading will be completed and approved and slope planting irrigation systems installed before occupancy of buildings.
28. The Contractor agrees that he shall assume sole and complete responsibility for job site conditions during the course of construction of this project including the safety of all persons and property; that this requirement shall apply continuously and not be limited to normal working hours; and that the Contractor shall defend, indemnify and hold the Owner and the Engineer harmless from any and all liability, real or alleged, in connection with the performance of work on this project, excepting for liability arising from the sole negligence of the Owner or the Engineer.
29. Prior to commencing work, a permit to operate in Fire Zone 4a, 5 shall be obtained from the fire department. Telephone (213)263-2461 for information.
30. All grassed areas must have drainage swales, berms and other drainage devices approved at the rough grading stage.
31. All storm drain work shall be done under continuous inspection by the Field Engineer. Weekly status reports shall be submitted to the Field Engineer by the local building and safety office.
32. Final grading must be approved before occupancy of any buildings will be allowed. 3017(a)
33. Temporary plans for temporary drainage and erosion control measures to be used during the rainy season must be submitted prior to October 1. The erosion control devices shown on said plans must be installed by that date and maintained in operable condition until April 15.
34. The grading contractor shall submit the statement required by Section 7017 at the completion of rough grading.

BENCHMARK
LOS ANGELES COUNTY MONUMENT W/PUNCHED 2" BRASS STAMPED "L.A.C.O.R.D. 1950" PER PARCEL MAP #22152, PARCEL MAP BOOK 231/ 15-18.



NOTE:
THIS PLAN IS FOR CONCEPT ONLY. SEE SHEETS C01,C02 FOR SITE LAYOUT AND DESIGN INFORMATION.

GEOLOGY AND SOILS NOTES

1. All recommendations included in the consultant's soil and geology report must be complied with and are a part of the grading specifications.
2. Grading operations shall be conducted under periodic geologic inspection with monthly reports to be submitted to the ENGINEERING GEOLOGIST and SOILS ENGINEER.
3. The remedial geologic report approves rough grading but final report prior to the request by the ENGINEER GEOLOGIST AND SOILS ENGINEER. The final report must include an AS-BUILT GEOLOGIC MAP.

PLANTING AND IRRIGATION NOTES

1. SEE LANDSCAPE AND IRRIGATION PLANS PREPARED BY SOUTHEAST FACILITY ENGINEERS FOR MORE INFORMATION.
2. All cut slopes over 5 feet and fill slopes over 3 feet shall be planted with an approved ground cover and provided with an irrigation system as soon as practical after rough grading. 7016(e)

GEOTECHNICAL/GEOLOGIC NOTES

1. BUILDING PADS LOCATED IN CUT/FILL TRANSITION AREAS SHALL BE OVEREXCAVATED A MIN. 3 FEET BELOW THE PROPOSED BOTTOM OF FOOTINGS.
2. RE-GRADING INSPECTIONS MUST BE MADE BY THE GEOLOGIST, GEOTECHNICAL ENGINEER. MONTHLY RE-GRADING INSPECTION REPORTS MUST BE SUBMITTED DIRECTLY TO THE GEOLOGIST AND SOILS SECTION BY THE CONSULTANTS.
3. ROUGH GRADING REPORT MUST BE APPROVED BY A FINAL GEOLOGY REPORT FINAL GEOTECHNICAL REPORT, PRIOR TO APPROVAL OF THE (3) FOOT SOILS CERTIFICATION AS-BUILT GEOLOGIC MAP MUST BE INCLUDED IN THE FINAL GEOLOGY REPORT. SUBMIT REPORT FOR APPROVAL FOR ISSUANCE OF BUILDING PERMITS.
4. FOUNDATION, WALLING, POOL EXCAVATION MUST BE INSPECTED AND APPROVED BY THE CONSULTANT GEOLOGIST, GEOTECHNICAL ENGINEER PRIOR TO PLACING STEEL OR CONCRETE.

WATER CONSTRUCTION NOTES

1. THE WATER SYSTEM SHALL BE INSTALLED IN ACCORDANCE WITH APPLICABLE SECTIONS OF THE STANDARD SPECIFICATIONS OF THE VALLEY COUNTY WATER DISTRICT EXCEPT WHERE OTHERWISE SHOWN ON MTES.
2. THE WATER MAINS SHALL BE AS INDICATED IN THE SPECIFICATIONS.
3. THE MINIMUM COVER FOR WATER LINES SHALL BE 36" FROM FINISHED GRADE.
4. ALL CONNECTIONS TO VALLEY COUNTY WATER DISTRICT FACILITIES SHALL BE UNDER LINE PRESSURE IN THE PRESENCE OF WATER COMPANY PERSONNEL.
5. CONTRACTOR SHALL CONTACT WATER COMPANY (818) 339-7301 FOR A PRE CONSTRUCTION CONFERENCE TO BE HELD A MINIMUM OF 2 WORKING DAYS PRIOR TO BEGINNING CONSTRUCTION.
6. ALL MAINLINE VALVES SHALL BE MAINTAINED SO AS TO BE ACCESSIBLE DURING TRACT DEVELOPMENT AND ALL VALVE STEM TOPS HAVING OVER 48" LOWER NUT HAVE EXTENSIONS ON THEM.
7. ALL METAL SURFACES EXPOSED TO THE SOIL SHALL BE COATED WITH A MASTIC COATING. MASTIC SHALL BE PROTECTION ENGINEERING'S CA-14 OR APPROVED EQUAL.
8. TIE-INS TO ON-SITE MAIN SHALL NOT BE MADE UNTIL AFTER MAIN IS TESTED AND DISINFECTED.
9. ALL TESTS SHALL BE MADE IN THE PRESENCE OF WATER COMPANY PERSONNEL.
10. ALL VALVE OPERATIONS ON EXISTING MAINS SHALL BE MADE BY WATER COMPANY PERSONNEL.

GENERAL UTILITY NOTES

1. CONTRACTOR SHALL NOTIFY THE UTILITY SERVICE ALERT AT 1-800-422-4133 48 HOURS MIN. TO START OF CONSTRUCTION.
2. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO LOCATE ALL SUBSTRUCTURES, WHETHER SHOWN HEREON OR NOT, AND PROTECT THEM FROM DAMAGE.
3. THE CONTRACTOR SHALL NOTIFY THE CITY ENGINEER AND ALL UTILITY COMPANIES CONCERNED AT LEAST 48 HOURS PRIOR TO COMMENCEMENT OF CONSTRUCTION. IT SHALL BE THE CONTRACTOR'S RESPONSIBILITY TO COORDINATE ALL PHASES OF CONSTRUCTION WITH THE VARIOUS UTILITY COMPANIES INVOLVED.
4. EXISTING UTILITIES SHALL BE MAINTAINED IN PLACE BY THE CONTRACTOR, UNLESS OTHERWISE NOTED.
5. ALL RESERVATIONS, EASEMENTS, RIGHTS-OF-WAYS, OVERHANGS, AND OTHER EXISTING IMPROVEMENTS TO BE REMOVED AND RECONSTRUCTED AS A RESULT OF CONSTRUCTION OPERATION SHALL BE CONSTRUCTED TO THE SAME ELEVATION AND LOCATION AS THE EXISTING IMPROVEMENTS, UNLESS OTHERWISE NOTED.
6. UTILITY LOCATIONS SHOWN HEREON REFLECT AVAILABLE RECORDS. PRIOR TO CONSTRUCTION, THE CONTRACTOR SHALL TAKE PRECAUTIONARY MEASURES TO LOCATE ALL UTILITY LINES HEREON AND ANY OTHER UTILITY LINES PRESENT. ALL UTILITY LINES HEREON SHALL NOTIFY THE FOLLOWING UTILITIES LOCATED IN THE CONSTRUCTION AREA BEFORE ANY WORK:

CITY OF IRWINDALE	818-960-4011 EXT.255
GENERAL TELEPHONE COMPANY	818-852-2108

Mr. C. E. Arnold
County Engineer & Surveyor
108 W. Second Street, Room 726
Los Angeles, California

Dear Sir:

Subject: Rock Quarry Case No. 39

Pursuant to provisions of Ordinance No. 1494 (Zoning Ordinance), this is to inform you that the United Concrete Pipe Corporation, represented by L.A.Cline, whose address is P. O. Box 425, Baldwin Park, California, (Phone No. CU-3-2101) has applied for a permit to establish, operate, and maintain a Rock Quarry and appurtenances

on property situated on the north side of Arrow Highway, approximately one mile west of Maine Avenue, northwesterly of the spillway of the Santa Fe dam.

A hearing in this matter is set for June 9, 1949, at 11:30 A.M., and will be held before the Zoning Board, in the Regional Planning Commission hearing room, Los Angeles County Engineering Building, 108 West Second Street, Los Angeles.

This department would appreciate a statement from you as to whether the development of this property to the requested use would adversely affect any existing or proposed projects or matters under your jurisdiction.

MEMORANDUM

To: Mr. A. G. Pickett
From: Mr. W. B. Baldwin
File: UNITED CONCRETE PIPE CO. ROCK QUARRY (I-593)
Date: May 27, 1949

I called Mr. Cline of the United Concrete Pipe Corporation relative to their application to the Zoning Commission for a permit to operate a rock quarry north of Arrow Highway near the San Gabriel River. He informed me that they wanted to extract and wash sand and gravel at this site. He stated that they were willing to cooperate with the County Departments to prevent the channel from becoming sealed with silt.

I also called Mr. A. B. Collins of the County Flood Control District and he informed me that they had referred this case to the U.S.E.D. and there was a possibility that they would oppose it because of the danger of undermining the dam. He said that if it was not opposed that he thought they should be regulated by Ordinance 614 to prevent the deposit of silt in the channel.

Dear Sir:

In accordance with instructions given by Mr. L. B. Adams, Director of Planning, County of Los Angeles, in letter dated June 20, 1947 in connection with Rock Quarry Case No. 39, which Case was approved by the Los Angeles County Board of Supervisors on June 24, 1947, we hereby make application for an Industrial Waste Permit as required by Ordinance No. 614 M.C., as amended.

Enclosed are four (4) copies of the application, Form 633 I W 7-46, also four (4) copies of our drawing No. L 323, dated March 29, 1947. This drawing is outlined in red the area zoned for quarry purpose and, also, in green the approximate location of the washed rock and sand screening plant.

Your favorable consideration of our application will be appreciated.

Yours very truly,

FORM 533 IM 7-46

APPLICATION FOR INDUSTRIAL WASTE PERMIT

Ordinance No. 614 N.S., as amended

COUNTY OF LOS ANGELES—OFFICE OF COUNTY ENGINEER
DIVISION OF SANITATION—INDUSTRIAL WASTE SECTION

Los Angeles, Calif. August 18 19 49

I hereby make application to dispose of industrial wastes derived from industrial or commercial processes described herein and located at No. 800 (old) Arrow Highway - approximately 1750 North of Arrow Highway-Baldwin Park District between Stewart Street and Peck Road Streets, Lot ....., Block ....., Tract Rancho Azusa de Duarte

Brief description of wastes, industrial or commercial processes, proposed method of disposal, and disposal facilities.

The operation to consist only of the installation of a small rock and sand screening plant of approximately 150 tons per hour capacity. No buildings to be constructed.

It is proposed to construct a small settling basin where any sand or debris which may be carried in the washing water will be deposited. The water so used will rapidly perculate through the porus rock and sand surface into the underground basin.

Sand and debris so deposited will not enter the presently located flood control channels.

Attention: Mr. Arthur Pickett

Dear Sir:

Your letter of August 23, 1949 notifies this office that the United Concrete Pipe Corporation has applied for an industrial waste permit under Ordinance 614 to conduct certain operations on their property located south of the Santa Fe Dam and north of Arrow Highway, your File I-593.

This office has no objection to the issuance of a permit to the United Concrete Pipe Corporation, provided that no wash water of any type is discharged into the streambed of the San Gabriel River or any of the shallow tributaries leading either to the San Gabriel River or the Rio Hondo.

Yours very truly,

H. E. Hedger, Chief Engineer

INSPECTOR'S REPORT

5-10-55

TO: Mr. E. K. Whittaker

FROM: Mr. J. C. Estadella

FILE: United Concrete Pipe Corp.
I-343-3c

DATE: May 4, 1955

REPORT: Mr. Neal Whittaker's report of inspection, dated 4-12-55, reports the discharge of liquid wastes to the San Gabriel River in violation of Industrial Waste Permit No 47.

Laboratory Analysis No 09201, dated 4-19-55 reveals no objectionable properties, however the discharge to the River or its tributaries is specifically forbidden by paragraph #2 of said Permit Conditions & Restrictions.

Today I interviewed Mr Jack Lowe, Plant Superintendent, and the following corrective action will be taken within 60 days:

1. Waste water from certain forms washing will be recirculated. This will reduce the volume of water discharged to their sewage basin by approx. 30%.
2. Leaching basins will be dug and filled with gravel to provide greater capacity & increased seepage capacities.
3. Should the above action fail to provide disposal of said water in accordance with their present Permit Regulations, Mr. Lowe

will then request an amendment to their permit to make changes in the area after the evaluation of approved pretreatment facilities.

In my opinion the corrective action outlined above should provide proper disposal and I have filed a time sch. dated 7-5-55 to federal Chemical on the matter.

MEMORANDUM

TO: Mr. John Partin
FROM: Mr. Harold Symmonds
FILE: United Concrete Pipe Company (I-593-30)
DATE: May 11, 1955

This afternoon, Mr. Charles T. Johnston, Assistant to the Vice-President, called in our office and related that one of our inspectors called to their attention that discharge from their seepage pits to the river was prohibited by our industrial waste permit. His company has obtained permission from the proper authorities for such discharge during storm periods, and it was his request for relief from the requirement of our industrial waste permit.

It was agreed that he would forward a letter to our office requesting modification of their industrial waste permit and including plot plans of their proposed operation and facilities. It was not their desire to violate any condition of our permit; but, however, they are in a state of emergency in event of another storm and would particularly request immediate consideration of their problem.

Attention: Mr. Arthur Pickett

Gentlemen:

This pertains to the disposal of industrial waste water, within our plant, under Permit #49 issued by your Department on August 21, 1949.

On May 3, 1955, your Mr. Estradillo visited our plant and informed us that the above permit did not cover the disposal of waste water into the outlet channel of Santa Fe Dam.

In order to reconcile our proposed operation, with your Department, we are submitting five copies of our sketch #12-15-54 which has been approved by the USED for installation.

In view of the above, it is respectfully requested that a new permit be issued that will cover the installation of the sump drain which will empty into the outlet channel of Santa Fe dam.

Thank you for your cooperation in the above matter.

Very truly yours,

UNITED CONCRETE PIPE CORPORATION

Gentlemen:

SUBJECT: United Concrete Pipe Corporation (I-593-30)

In accordance with requirements of Sections 6207 and 6208 of Ordinance No. 6130, your recommendations are requested in the matter of amending Industrial Waste Permit No. 47 to include the following operation. Under the conditions of their permit, they are allowed to discharge their waste water into sumps. During heavy rains, these sumps become filled with storm water and it is requested that they be permitted to discharge the excess water into the outlet channel of the Santa Fe Dam. Attached is a plot plan showing the details of the drainage sump and pipe going to the channel.

This application will be discussed at the next Industrial Waste Committee Meeting tentatively set for June 7, 1955.

It is particularly requested that your recommendations be submitted to this office not later than the week immediately following the Committee meeting.

Yours very truly,

William J. Fox

Attention: Mr. Arthur Pickett Ref. File #I-593

Gentlemen:

Please refer to our letter dated May 13, 1955 requesting that a new permit be issued to cover our problems relative to industrial waste.

Enclosed find six copies of a composit print showing our main plant layout at 14041 East Arrow Highway, Baldwin Park, California. Included thereon is the location of the collection sump and the drain line with automatic gate for which we are requesting permit modification.

We therefore wish to correct our previous request for a new permit and now request that our Permit #17 be revised to include the sump drain and any other features pertaining thereto that are not now covered.

Permits Issued (2)

AMENDED SPECIAL CONDITIONS AND LIMITATIONS
FOR INDUSTRIAL WASTE PERMIT NO. 47 ISSUED TO
UNITED CONCRETE PIPE CORPORATION
IRWINDALE AND AZUSA ROADWAY, BALDWIN PARK, CALIFORNIA

1. This permit shall apply to the disposal of all liquid industrial wastes produced from de-silting wash sand sand from the plant of the United Concrete Pipe Corporation as shown on plot plan submitted to the County Engineer on June 7, 1955.

2. Liquid industrial waste may be disposed of by means of seepage beds on property under control of the above corporation and shall not be permitted to enter the streambed of the San Gabriel River or any tributary thereto of the San Gabriel River or the Rose River except during periods of major storm conditions.

3. During periods of major storm conditions, overflow from said seepage beds may be permitted to discharge into the outlet channel of the Santa Fe Dam by means of a drain as shown in detail on a plan submitted to the County Engineer on May 17, 1955.

4. Liquid industrial waste as discharged shall not contain substances in concentration to be toxic to human, animal, or plant life.

5. No nuisance shall be created by the discharge of liquid industrial waste as herein permitted.

6. Representatives of interested governmental agencies concerned with the disposal of industrial wastes shall be permitted access at any reasonable time to take samples and inspect operations.

7. The County Engineer may modify this permit by addition or elimination of conditions and limitations herein as may be necessary to accomplish the purpose of County Ordinance No. 6130, governing the disposal of waste materials.

8. Violation of any of the conditions of this permit will be cause for suspension or revocation of this permit.

SUBJECT: United Concrete Pipe Corp. (I-593-30)
File No. 55-72

Attention: Mr. Arthur Pickett, Division Engr.
Industrial Waste Division

Dear Sir:

Reference is made to your letter of May 27,1955, relative to application for revision of Los Angeles County Industrial Waste Permit No. 47 by the United Concrete Pipe Corporation for disposal of their waste water into sumps and with discharge of excess to the San Gabriel River immediately downstream of the Santa Fe Dam.

In accordance with administrative procedures established for the handling of industrial waste permits between your office and this Board, a representative of this office met with the Los Angeles County Industrial Waste Committee to review the application of the subject company.

At the meeting of the Los Angeles County Industrial Waste Committee, the following conditions and limitations were formulated.

1. Wastes shall be limited to waste water from washing of gravel and sand and curing of concrete pipe.

2. Wastes disposed of to the watercourse shall not result in a condition of nuisance by reason of unsightliness or excess turbidity imparted to the waters of the San Gabriel River.

3. No sludge deposits shall be formed by reason of the disposal of wastes to the San Gabriel River.

4. In no event shall wastes toxic to human, animal, plant, fish, or bird life be disposed of to the watercourse.

5. From time to time as conditions demand, these requirements may be revised.

It is the opinion of the Executive Officer that a permit issued subject to the above limitations and conditions will meet the requirements of this Regional Board. However, in accordance with Paragraph (e) of the Administrative Procedures, limitations and conditions pertaining to water pollution and nuisance will still require official action by the Board.

Mr. William J. Fox, County Engr.
Los Angeles County

United Concrete Pipe Corporation
(Our File No. 55-71) (I-593-30)

Dear Sir:

Reference is made to your letter of July 11, 1955 to United Concrete Pipe Corporation which transmitted Industrial Waste Permit No. 47 issued to United Concrete Pipe Corp., copies of which were furnished to this Board.

Pursuant to administrative procedures established between your office and this Board, and to prevent a condition of pollution in the receiving waters, and to prevent the creation of a nuisance in the disposal area in compliance with Section 13054 of the State Water Code, the Los Angeles Regional Water Pollution Control Board No. 4 at its regular meeting held on July 28, 1955 approved as the requirements of this Board the conditions and limitations pertaining to water pollution and nuisance to be contained in Los Angeles County Industrial Waste Permit No. 47.

For your convenience there is enclosed a copy of this letter for transmittal to United Concrete Pipe Corp. in accordance with administrative procedures established between your office and this Board.

Very truly yours,

UNITED CONCRETE PIPE (I-593) CITY OF IRWINDALE

This company manufactures concrete pipe at their plant within the City of Irwindale. Prior to the inclusion of this facility into the City of Irwindale, it was regulated by Los Angeles County Industrial Waste Permit No. 47. Process and wash water are normally stored in a sump and recirculated in a closed system. This permit prohibited the discharge of any of this water to the San Gabriel River Flood Control Channel. It was later revised to permit the overflow from the storage sump to go to the San Gabriel River during times of major storms. This company has now requested an Industrial Waste Disposal Permit to be issued by the City of Irwindale to dispose of the overflow from the storage sump to the San Gabriel River at all times.

The purpose of the restriction against the discharge of pond overflow to the San Gabriel River was to prevent the sealing of the surface of the unlined channel by fine suspended solids. The seepage from the pond has proved to be less than the make up wash water and overflow from the pond has occurred during dry weather. Observation of the site indicates that the pond overflow seeps in the river channel immediately adjacent to the overflow point. No significant area in the river channel has been affected by the overflow.

The Industrial Waste Committee decided that the disposal permit, as requested, could be issued with the limitation that the waste water shall not seal off a significant area of the unlined San Gabriel River Channel bottom.

BALL LAUNDRY (I-5428) SAUGUS

This company has applied for an Industrial Waste Disposal Permit to cover the discharge of liquid industrial wastes originating from the operation of a laundromat to an underground disposal system. There will be no water softening equipment installed on the site.

The Industrial Waste Committee decided that a permit would be issued with conditions and limitations similar to the usual conditions and limitations in permits issued for the subsurface disposal of waste water from automobile wash racks with the further limitation that the total dissolved solids content not exceed 1,500 parts per million.

OFFICE OF COUNTY HEALTH DEPARTMENT

CITY OF IRWINDALE (I-593)

Your application for an Industrial Waste Disposal Permit together with your check in the amount of $15 was received in this office on August 6, 1962.

Investigation of your application has been completed and we are now prepared to issue the necessary permit. However, Section 4131 of the Municipal Code of the City of Irwindale requires that you forward the annual permit fee in the amount of $25 before the permit can be issued.

The annual permit fee will cover inspection service costs pertaining to discharge of industrial wastes from your industry.

INDUSTRIAL WASTE DISPOSAL PERMIT

NO. 47

FILE: I-593-38

DATE: October 31, 1962

Permission is hereby granted under Chapter 1, Article V of the Municipal Code of the City of Irwindale

to UNITED CONCRETE PIPE CORPORATION

P.O. BOX 425, BALDWIN PARK, CALIFORNIA
(Mailing Address)

to discharge or deposit waste or other material from or upon the premises located at

14041 EAST LIVE OAK IN THE CITY OF IRWINDALE

Materials covered by this permit shall consist of:

Wash water produced from the

manufacture of concrete pipe

The above materials shall be disposed of in accordance with the special conditions and limitations attached hereto. Any solid or liquid material or substance not specifically described above shall be disposed of only at an approved legal point of disposal.

This permit is not transferable from one location to another and may be revoked if used contrary to the provisions of this permit or of the above Ordinance.

This permit does not relieve the permittee from the obligation to conform with the requirements of any other governmental agency having jurisdiction.

APPROVED:

JOHN A. LAMBIE
CITY ENGINEER

SPECIAL CONDITIONS AND LIMITATIONS
INDUSTRIAL WASTE DISPOSAL PERMIT NO. 47
UNITED CONCRETE PIPE CORPORATION (I-593-36)
CITY OF IRWINDALE

---

1. This permit is issued to the United Concrete Pipe Corporation for the disposal of industrial wastes produced from the manufacture of concrete pipe at 14041 East Live Oak in the City of Irwindale.

2. Wash water from the manufacture of concrete pipe may be discharged to an unlined storage sump on the site.

3. Overflow wash water from the storage sump may be discharged to the San Gabriel River provided it does not seal off a significant area of the unlined river bottom.

4. The water discharged shall not contain substances in concentrations capable of imparting objectionable color, taste or odors to surface or underground water.

5. In no event shall any substances be discharged in concentrations toxic to human, animal, or plant life.

6. All liquid industrial waste and water soluble solid wastes produced at the above location and not acceptable for disposal at this site shall be stored in impervious containers pending transportation to a legal point of disposal. The permittee shall certify by signing waste hauler's reports, the material, source, quantity and point of disposal for all such wastes removed from the premises for disposal at any other location. The signed original of this report shall be forwarded to the City Engineer as indicated thereon.

7. Representatives of interested governmental agencies concerned with the disposal of industrial wastes shall be permitted access at any reasonable time to take samples and inspect operations.

8. The City Engineer may modify this permit by addition or elimination of conditions as may be necessary to accomplish the purposes of ordinances, laws, or regulations covering the disposal of industrial wastes.

9. The City Engineer shall be notified and his written approval secured before making any additions and modifications which may affect the quantity, quality, or method of disposal of waste materials.

10. Waste disposal operations shall be conducted in such a manner that no nuisance is created.

11. Violation of any of the conditions of this permit shall be cause for suspension or revocation of this permit.

Gentlemen:

UNITED CONCRETE PIPE CORPORATION
(I-593-38)

The disposal of industrial waste from your plant at 14041 East Live Oak, Irwindale, is covered by permit No. 47 issued October 31, 1962.

City Council Resolution No. 59-34 establishes an annual fee of $25 which must be paid to the County Engineer to cover inspection service costs under this permit.

Your permit expires October 31, 1972, unless it is renewed. To renew your permit, please send the fee for the period starting October 31, 1972 to Harvey T. Brandt, County Engineer, 5908 North Kauffman Avenue, Temple City, California.

Yours very truly,

Harvey T. Brandt
COUNTY ENGINEER

INSPECTOR'S REPORT

TO: Leo J. Collins DATE: 5/2/73

FROM: Jerry Y. Wong FILE: I #593

INDUSTRY: United Concrete Pipe Corp.
14041 E. Live Oak Ave., Irwindale

REPORT: Following items requested by Carl Sjoberg:

Quantities: Water intake from well, 600,000 gallons per day.

Water usage in plant:

(1) Cooling water 10,000 gallons per day.

(2) Boiler feed water 100,000 gallons per day.

(3) Process water (concrete curing) 470,000 gallons per day.

(4) Domestic waste usage 20,000 gallons per day.

Waste water discharges:

1. Underground disposal 180,000 gallons per day.

2. Overflow to channel 200,000 gallons per day.

Treatment Facilities: Unlined settling pond, approx. 43,000 sq. ft. area, with overflow to San Gabriel River. The settling pond is of such capacity that the water is retained for approx. two weeks.

Disposal: Seepage into ground from unlined pond. Overflow from pond to San Gabriel River.

Type of Industrial Waste:

(1) Boiler blowdown with Chem-Aqua #100 and #900 (National Chemsearch Corp.) used for treatment of intake water.

(2) Boiler softener discharge.

(3) Washdown process area

(4) Water discharge from concrete curing process

NOTICE

APPLICATION FOR WASTE DISCHARGE REQUIREMENTS
(National Pollutant Discharge Elimination System Permit)

FOR

UNITED STATES PIPE AND FOUNDRY COMPANY
Concrete Pipe Division

United States Pipe and Foundry Company, Concrete Pipe Division, 14041 East Live Oak Avenue, Baldwin Park, California, has filed a Report of Waste Discharge and has applied for requirements for the discharge of wastes.

United States Pipe and Foundry Company, Concrete Pipe Division, manufactures concrete pipe at the above address in the Cities of Baldwin Park and Irwindale, and discharges up to 200,000 gallons per day of holding pond bleed-off, consisting of concrete curing water, boiler blowdown, water softener regeneration wastes, cooling water, steam condensate, and storm runoff, directly into San Gabriel River, approximately 200 feet north of the Live Oak Avenue bridge, above the tidal prism.

On the basis of preliminary staff review and application of lawful standards and regulations, the California Regional Water Quality Control Board, Los Angeles Region, tentatively proposes to issue waste discharge requirements, including effluent limitations and special conditions. Persons wishing to comment upon or object to the tentative discharge requirements are invited to submit same in writing to the above address no later than November 14, 1974. All comments or objections received by that date will be considered in the formulation of final determinations regarding the waste discharge. If no objections are received, the Regional Board will issue discharge requirements. A public hearing will be held by the Board on November 18, 1974, at 107 South Broadway, Room 1138, Los Angeles, California. Interested persons are invited to attend. The Board will hear any testimony pertinent to the waste discharge and the tentative waste discharge requirements. Oral statements will be heard; however, for the accuracy of the record, all important testimony should be in writing. The hearing will begin at 10:00 a.m.

The Report of Waste Discharge, related documents, tentative requirements, comments received, and other information are on file and may be inspected at 107 South Broadway, Room 4027, Los Angeles, California, 90012, between the hours of 8:00 a.m. and 4:00 p.m. Arrangements for copies may be made.

Date OCT - 7 1974

CA 0001597

With respect to the public notice, in accordance with the Federal Water Pollution Control Act, as amended in 1972, and the California Administrative Code, you are required to follow the enclosed instructions for publication and posting of the notice not later than October 10, 1974.

Failure to publish the notice will prevent the adoption of waste discharge requirements; to discharge without requirements subjects you to civil penalties of up to $10,000 for each day in which such discharge occurs. Failure to publish the notice by the above date will force us to reschedule this item for a later hearing and will require the publication and posting of a second notice. Please notify this Board by telephone when the notice has been published and submit the proof of publication as required in the enclosed instructions.

Proof of posting and publication of the notice must be submitted to the Executive Officer of this Regional Board by October 29, 1974.

If you have any questions, please call us at (213) 620-4460.

Very truly yours,

RAYMOND M. HERTEL
Executive Officer

INSTRUCTIONS TO APPLICANT FOR
WASTE DISCHARGE REQUIREMENTS
UNITED STATES PIPE AND FOUNDRY COMPANY
Concrete Pipe Division
CA0001597

Five copies of a notice of your report of waste discharge and a statement of posting form are enclosed. You are directed to post two copies of the notice in conspicuous places accessible to the public in the locality to be affected by the proposed discharge by October 10, 1974.

You must file with this office proof of such posting. Proof of posting shall consist of a statement executed on the enclosed form to be submitted to this Board by October 29, 1974.

You are also directed to have this notice published in the Los Angeles Herald-Examiner or Los Angeles Times for five consecutive days, with the expense of publication to be paid by the discharger. The first notice must be published no later than October 10, 1974.

You must file with this office proof of publication. Proof of publication shall consist of an affidavit of the publisher or foreman of the newspaper, with copy of the notice, as published, attached. This must be submitted to this Board by October 29, 1974.

Failure to post and publish the public notice as instructed by the specified date will force us to reschedule this item for a later hearing and will require the posting and publication of a second notice.

12. Additional Information

112 Item Number	Information
109a1	Dry weather flow from discharge 001 is "zero"
	Maximum wet weather discharge from 001 is estimated at 3 MGD
109f1&109i1	* Due to water curing of concrete pipe

OMB No. 158-R0100

FOR AGENCY USE

13. Activity Description (Give a narrative description of activity producing this discharge.(see instructions)

(13a)

Manufacture of concrete and steel pipe. Process wastewater produced by noncontact cooling water containing no additives and washdown of concrete pouring areas and equipment. In addition, small volume contributed by steam condensate, boiler blowdown, and boiler water softener regeneration. Actual discharge from 001 is the result of stormwater runoff added to wastewater collection system during wet weather.

NOTE: No cooling towers are used at this plant location.

14. Activity Causing Discharge For each SIC Code which describes the activity causing this discharge, supply the type and maximum amount of either the raw material consumed (Item 14a) or the product produced (Item 14b) in the units specified in Table I of the Instruction Booklet. For SIC Codes not listed in Table I, use raw material or production units normally used for measuring production.(see instructions)

a. Raw Materials

(14a) SIC Code (1)	Name (2)	Maximum Amount/Day (3)	Unit (See Table I) (4)	Shared Discharges (Serial Number) (5)

b. Products

(14b) SIC Code (1)	Name (2)	Maximum Amount/Day (3)	Unit (See Table I) (4)	Shared Discharges (Serial Number) (5)
3272	Concrete Pipe	0.4	1000 Tons	None

FOR AGENCY USE

15. Waste Abatement

a. Waste Abatement Practices
Describe the waste abatement practices used on this discharge with a brief narrative. (see instructions)

215a.

Narrative: Process wastewater and stormwater runoff are treated in settling ponds from which it is recycled back to the plant for use in concrete pipe curing. Any discharges from our property occur only as a result of heavy rainfall.

b. Waste Abatement Codes
Using the codes listed in Table II of the instruction booklet, describe the waste abatement processes for this discharge in the order in which they occur if possible.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO. _____

NPDES NO. CA0001597

WASTE DISCHARGE REQUIREMENTS
FOR
UNITED STATES PIPE AND FOUNDRY COMPANY
CONCRETE PIPE DIVISION

TENTATIVE

The California Regional Water Quality Control Board, Los Angeles Region, finds:

1. United States Pipe and Foundry Company, Concrete Pipe Division, has filed a report of waste discharge and has applied for a permit to discharge wastes under the National Pollutant Discharge Elimination System.

2. United States Pipe and Foundry Company, Concrete Pipe Division, manufactures concrete pipe at a facility located at 14041 East Live Oak Avenue, Irwindale, California. Wastewater consisting of concrete curing water, boiler blowdown, water softener regeneration wastes, cooling water, steam condensate, and storm runoff is treated in settling ponds and discharged to a collection pond, from which it is recirculated back to the plant for use in concrete pipe curing. Wastes are discharged from the collection pond as surface flow into San Gabriel River at a point about 200 feet north of the Live Oak Avenue bridge, above the tidal prism, and by subsurface percolation. A total of about 280,000 gallons per day of wastewater is discharged from the pond, of which about 200,000 gallons per day reaches the river during dry-weather periods. About 20,000 gallons per day of sanitary sewage is disposed of by means of a private subsurface septic tank-leach field system at the site.

3. On July 26, 1954, the Board prescribed Requirement No. 1054 for this discharge, and updated that Requirement on December 1, 1967.

4. The Board adopted an Interim Water Quality Control Plan for Santa Clara and Los Angeles River Basins on June 16, 1971, and updated that Plan on December 13, 1974. The Interim Basin Plan contains water quality objectives for surface waters of the Los Angeles River Basin, including San Gabriel River.

5. The beneficial uses of the receiving waters are as follows: Water-contact and non-water contact recreation, agricultural supply, groundwater recharge, freshwater habitat, and fishing the tidal prism warm habitat.

6. Effluent limitations guidelines established pursuant to Section 301 of the Federal Water Pollution Control Act and amendments thereto are applicable to the discharge

Order
United States Pipe and Foundry Company
Concrete Pipe Division (CA0000507)

The Board has notified the discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

The Board in a public hearing heard and considered all comments pertaining to the discharge and to the tentative requirements.

This Order shall serve as a National Pollutant Discharge Elimination System permit pursuant to Section 402 of the Federal Water Pollution Control Act, or amendments thereto, and shall take effect at the end of ten days from the date of its adoption, provided the Regional Administrator, EPA, has no objections.

IT IS HEREBY ORDERED, that United States Pipe and Foundry Company, Concrete Pipe Division, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Federal Water Pollution Control Act and regulations and guidelines adopted thereunder, shall comply with the following:

A. Industrial Effluent Limitations

1. Wastes discharged shall be limited to those described hereinabove, as proposed.

2. The discharge of an effluent in excess of the following limits is prohibited:

Constituent	Discharge Rate (lbs/day) Maximum Daily	30-Day Average	Concentration Limit (mg/l) Average	Maximum
Suspended solids	253.6	126.8	40	80
Settleable solids	----	----	0.1 1/	0.2 1/
Oil and grease	47.6	21.7	10	15
Total dissolved solids	2,380.	2,380.	----	750
Chlorides	555.	555.	----	175
Chloride plus sulfate	1,585.	1,585.	----	500
Nitrate nitrogen	31.7	31.7	----	10
COD	253.6	126.8	40	80
Total chromium	0.0317	0.0158	.005	0.01
Total hardness (as $CaCO_3$)	1,585	1,585.	----	500
Turbidity	----	----	50 2/	75 2/

1/ In ml/l.
2/ In turbidity units (TU).

TENTATIVE

7. The discharges shall not cause [illegible] the best [illegible] available, and which [illegible] discharges [illegible] effluents or waters, as the Commissioner deems [illegible]

Constituent	Discharge Rate (lbs/day) Maximum Daily	Monthly Average	Concentration (mg/l) Daily Average	Monthly
Suspended solids	120.8	63.4	20	40
COD	126.8	63.4	20	[illegible]

TENTATIVE

4. The daily discharge rate shall be obtained from the following calculations for any calendar day:

$$\text{Daily discharge rate} = \frac{C_1 Q_1 + C_2 Q_2 + \cdots + C_N Q_N}{N}$$

in which N is the number of samples analyzed in any calendar day. Q_1 and Q_2 are the flow rate (MGD) and the constituent concentration (mg/l) respectively, which are associated with each of the N grab samples which may be taken in any calendar day. If a composite sample is taken, C_1 is the concentration measured in the composite sample and Q_1 is the average flow rate occurring during the period over which samples are composited.

5. The 30-day average discharge rate shall be the arithmetic average of all the values of daily discharge rate calculated using the results of analyses of all samples collected during any 30 consecutive calendar day period. If fewer than four samples are collected and analyzed during any 30 consecutive calendar day period, compliance with the 30-day average rate limitation shall not be determined.

6. The pH of wastes discharged shall at all times be within the range 6.5 to 9.0.

7. The temperature of wastes discharged shall not exceed 100°F.

8. Wastes discharged shall not contain visible oil or grease, and shall not cause the appearance of grease, oil or oily slick, or foam in the receiving waters or on channel banks, walls, inverts or other structures.

9. Wastes discharged shall not cause the formation of sludge deposits.

10. Neither the disposal nor any handling of waste shall cause pollution or nuisance.

11. Wastes discharged shall not damage flood control structures or facilities.

12. This discharge shall not cause a violation of any applicable water quality standard for receiving waters adopted by the Regional Board or the State Water Resources Control Board as required by the Federal Water Pollution Control Act and regulations adopted thereunder. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Federal Water Pollution Control Act, or amendments thereto, the Board will revise and modify this Order in accordance with such more stringent standards.

TENTATIVE

B. Requirements for Sewage Disposal

1. All sewage discharged other than into a community sewer system shall be disposed of underground in accordance with local ordinances controlling the construction and operation of private sewage disposal systems, and in accordance with all rules and regulations of the health department having jurisdiction.

2. No part of a waste-leaching system shall be closer than 100 feet to any water well.

3. No part of a subsurface sewage disposal system shall extend to a depth where wastes may deleteriously affect an underground water stratum that is usable for domestic purposes, and in no case within 5 feet of the zone of fluctuating groundwater.

C. Provisions

1. This order includes the following items of the attached "Standard Provisions": 1, 2, 4, 5, 6, 7, 8, 9, 10, and 11.

2. This Order includes the following items of the attached "Reporting Requirements": 1, 5, and 8.

3. This Order includes the attached "General Monitoring and Reporting Provisions."

4. This Order expires on November 26, 1979, and the discharger must file a Report of Waste Discharge in accordance with Title 23, California Administrative Code, not later than 180 days in advance of such date as application for issuance of new waste discharge requirements.

5. A copy of these waste discharge specifications shall be maintained at the discharge facility so as to be available at all times to operating personnel.

6. In the event of any change in name, ownership, or control of these waste disposal facilities, the discharger shall notify this Board of such change and shall notify the succeeding owner or operator of the existence of this Order by letter, copy of which shall be forwarded to the Board.

7. Any discharge of wastes [illegible] other than specifically covered in this permit is prohibited, and constitutes a violation of the permit.

TENTATIVE

3. Sewage shall not be disposed of to a pressure sewage disposal system or a partial pressure disposal system where a community sewage system becomes available.

4. Requirement No. 3214, adopted by this Board July 28, 1955, and Updated December 12, 1961, is hereby rescinded.

COD	mg/l	grab	monthly
Total hardness (as $CaCO_3$)	mg/l	grab	monthly
Soluble iron	mg/l	grab	quarterly
Manganese	mg/l	grab	quarterly

* By the trichlorotrifluoroethane extraction method.
** By plasma [illegible] titration with evaporation at 180°C. Reference: "Methods for Chemical Analysis of Water and Wastes," 1971, Environmental Protection Agency (EPA Manual), p. 275.

Operation and Maintenance Report

The discharger shall submit a technical report with this Board not later than sixty days after receipt of this permit, relative to the operation and maintenance program for this waste discharge facility. The information to be contained in that report shall include, as a minimum, the following:

a. The name and address of the person or company responsible for operation and maintenance of the facility.

b. Type of maintenance (preventive or corrective).

c. Frequency of maintenance, if preventive.

_____
Date

TENTATIVE

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION
MONITORING AND REPORTING PROGRAM NO. _____
FOR
UNITED STATES PIPE AND FOUNDRY COMPANY
CONCRETE PIPE DIVISION
(File No. 55-71)

The discharger shall implement this monitoring program on the effective date of this Order. The first monitoring report under this program is due by January 15, 1980.

Monitoring reports shall be submitted by the dates in the following schedule:

Reporting Period	Report Due
January - March	April 15
April - June	July 15
July - September	October 15
October - December	January 15

If no flow occurred during the quarter the report shall so state.

TENTATIVE

Effluent Monitoring

A sampling station shall be established for each point of discharge and shall be located where representative samples of that effluent can be obtained. The following shall constitute the effluent monitoring program:

Constituent	Units	Type of Sample	Minimum Frequency of Analysis
Total waste flow	gal/day	---	quarterly
Total dissolved solids	mg/l	grab	quarterly

Each monitoring report must affirm in writing that:

> All analyses were conducted at a laboratory certified for such analyses by the State Department of Health Services and in accordance with current EPA guideline procedures or as specified in the Monitoring Program.

For any analysis performed for which no procedure is specified in the EPA guidelines or in this Monitoring Program, the constituent or parameter analyzed and the method or procedure used must be specified in the report.

Reporting for Leachfield Disposal

Each report shall contain the following information:

a. A statement relative to compliance with discharge specifications during the reporting period.

Hauling Report

In the event wastes are transported to a different disposal site during the reporting period, the following shall be reported:

a. Type of wastes and quantity of each type;

b. Name and either the address or the state registration number for each hauler of wastes (or the method of transport if other than by hauling); and

c. Location of the final point(s) of disposal for each type of waste.

If no wastes are transported offsite during the reporting period, a statement to that effect shall be submitted.

GENERAL PROVISIONS FOR SAMPLING AND ANALYSIS

All sampling, sample preservation, and analyses shall be performed in accordance with the latest edition of "Guidelines Establishing Test Procedures for Analysis of Pollutants", promulgated by the United States Environmental Protection Agency.

All chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by the State Department of Health Services.

Effluent samples shall be taken downstream of any addition to the treatment works and prior to mixing with the receiving waters.

The discharger shall calibrate and perform maintenance procedures on all monitoring instruments and equipment to insure accuracy of measurements, or shall insure that both activities will be conducted.

A grab sample is defined as an individual sample collected in fewer than 15 minutes.

GENERAL PROVISIONS FOR REPORTING

For every item where the requirements are not met, the discharger shall submit a statement of the actions undertaken or proposed which will bring the discharge into full compliance with requirements at the earliest time and submit a timetable for correction.

By January 30 of each year, the discharger shall submit an annual report to the Board. The report shall contain both tabular and graphical summaries of the monitoring data obtained during the previous year. In addition, the discharger shall discuss the compliance record and the corrective actions taken or planned which may be needed to bring the discharge into full compliance with the waste discharge requirements.

TENTATIVE

The discharger shall maintain all sampling and analytical results, including strip charts; date, exact place, and time of sampling; date analyses were performed; analyst's name, analytical techniques used; and results of all analyses. Such records shall be retained for a minimum of three years. This period of retention shall be extended during the course of any unresolved litigation regarding this discharge or when requested by the Board.

In reporting the monitoring data, the discharger shall arrange the data in tabular form so that the date, the constituents, and the concentrations are readily discernible.

Each report shall contain the following completed declaration:

"I declare under penalty of perjury that the foregoing is true and correct. Executed on the _____ day of _____ at _____, _____.

_____ (Signature)

_____ (Title)".

These records and reports are public documents and shall be made available for inspection during business hours at the office of the California Regional Water Quality Control Board, Los Angeles Region.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO. _____

WASTE DISCHARGE REQUIREMENTS
FOR

UNITED STATES PIPE AND FOUNDRY COMPANY
CONCRETE PIPE DIVISION
(File No. 55-71)

The California Regional Water Quality Control Board, Los Angeles Region, finds:

TENTATIVE

1. United States Pipe and Foundry Company (a corporation), Concrete Pipe Division, discharges wastes to a pond under waste discharge requirements contained in Requirement No. 1056 adopted by this Board on July 28, 1955, and updated on December 12, 1962.

2. United States Pipe and Foundry Company, Concrete Pipe Division, manufactures concrete and steel pipe at 14041 East Live Oak Avenue, Irwindale, California, and discharges up to 90,000 gallons per day of wastewater to an unlined pond. The wastewater results from concrete curing, washdown of concrete pouring areas and equipment, single-pass non-contact compressor cooling, boiler blowdown, water softener regeneration, steam condensate, and rainfall runoff. Concrete curing water is supplied from the pond, which is used to settle out solids and recycle the supernatant.

   An average of 10,000 gallons per day of sanitary sewage is also disposed of by means of a private sewage disposal system consisting of a septic tank and leach field at the site. A community sewage disposal system is not available.

3. The sediment accumulated in the settling pond is periodically removed and disposed of at a legal disposal site.

4. The settling pond and leach field areas are located in Section 6, T1S, R10W, S.B.B.&M., overlying the Main San Gabriel Valley Ground Water Basin and within the Main San Gabriel Hydrologic Subarea, Westerly Portion.

5. The site is underlain by water-bearing alluvial deposits of recent and upper pleistocene sediments. The groundwater is generally unconfined. Calcium in the concrete curing water is believed to harden the pond sediments resulting in reduced percolation of wastes into the ground, such that there should be little effect on the quality of the local groundwaters.

6. A water well located east of the Main Shop Building provides most of the industrial water supply. The remainder is city water.

7. This Order pertains only to the discharge of industrial wastes and sanitary sewage by percolation, as described hereinabove. The discharge to navigable waters is subject to a separate Order and NPDES permit adopted by this Board.

8. The Board adopted a revised Water Quality Control Plan for Los Angeles River Basin on November 27, 1978. The Plan contains water quality objectives for groundwaters of the Main San Gabriel Valley Groundwater Basin. The requirements contained in this Order as they are met will be in conformance with the goals of the Water Quality Control Plan.

9. The beneficial uses of the receiving groundwaters are: municipal and domestic, agricultural, and industrial service and process supply.

10. The original waste discharge requirements were adopted by this Board on July 28, 1955, and, as such, this constitutes an ongoing project as defined by Section 2715 of the State Water Resources Control Board regulations and is exempt from the provisions of the California Environmental Quality Act.

The Board has notified the discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

The Board in a public meeting heard and considered all comments pertaining to the discharge and to the tentative requirements.

IT IS HEREBY ORDERED, that United States Pipe and Foundry Company, Concrete Pipe Division, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, shall comply with the following:

TENTATIVE

A. Industrial Waste Discharge Requirements:

1. The discharge of wastewaters to the ground from unlined ponds in excess of the following limits is prohibited:

Constituent	Concentration Limit (mg/l)
Total dissolved solids	750

2. The discharge of wastes to any watercourse, drainage ditch, or any tributary to surface waters is prohibited except as provided for in an NPDES permit.

B. Sewage Discharge Requirements:

1. Wastes shall be disposed of underground in accordance with local ordinances controlling the construction and operation of private sewage disposal systems, and in accordance with all rules and regulations of the Los Angeles County Department of Health Services.

2. The sewage treatment and disposal system shall be maintained in such a manner that at no time will raw sewage or septic tank effluent be permitted to surface or overflow.

3. No part of any waste disposal system shall be closer than 100 feet to any water well, nor closer than 50 feet from a stream channel or watercourse.

4. No part of any subsurface sewage disposal system shall extend to a depth where wastes may deleteriously affect an underground water stratum that is usable for domestic purposes, and in no case within 5 feet of the zone of fluctuating groundwater.

5. The discharge of raw or inadequately treated sewage at any time is prohibited.

6. Within six months after the collector lines for a sewage disposal system become available, the disposal of sewage to the ground shall cease.

C. General Waste Discharge Requirements

1. Neither the disposal nor handling of wastes shall cause pollution or nuisance, or problems due to breeding of mosquitoes, gnats, midges, flies or other vectors.

2. Wastes discharged shall not contain any substance in concentrations toxic to human, animal, plant or aquatic life.

3. All wastes which do not meet each of the foregoing requirements shall be held in impervious containers, and if transferred elsewhere the final discharge shall be at a legal point of disposal, and in accordance with provisions of Division 7.5 of the Water Code. For the purpose of these requirements, a legal point of disposal is defined as one for which waste discharge [illegible] established by a California [illegible] Quality Control Board, and which is in full compliance therewith.

TENTATIVE

4. Wastes discharged shall not contain any substance in concentrations sufficient to impart taste, odor, color, foaming or other objectionable characteristics to usable groundwaters.

5. Wastes shall be discharged only at the site covered by these requirements and only on property owned or controlled by the discharger.

D. Provisions

1. This sewage disposal facility shall be compatible with regional sewerage plans and this waste discharge shall be connected into a community sewer system when such a system is available to the site.

2. A copy of this Order shall be maintained where it will be available at all times to operating personnel.

3. In accordance with Section 13260(b) of the Water Code, the discharger shall file a report of any material change or proposed change in the character, location or volume of the discharge.

4. In the event of any change in name, ownership, or control of these waste disposal facilities, the discharger shall notify this Board of such change and shall notify the succeeding owner or operator of the existence of this Order by letter, copy of which shall be forwarded to the Board.

5. The discharger shall notify this Board immediately by telephone of any adverse condition resulting from these discharges or from operations producing these waste discharges, such notifications to be affirmed in writing, within one week.

6. In accordance with Section 13267 of the Water Code the discharger shall furnish, under penalty of perjury, technical monitoring program reports; such reports shall be submitted in accordance with specifications prepared by the Executive Officer, which specifications are subject to periodic revisions as may be warranted.

7. Requirement No. 1056, adopted by this Board on July 28, 1955, and updated on December 12, 1962, is hereby rescinded.

State of California
Resources Agency
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO._____

NPDES NO. CA0001597

WASTE DISCHARGE REQUIREMENTS
FOR

UNITED STATES PIPE AND FOUNDRY COMPANY
CONCRETE PIPE DIVISION

The California Regional Water Quality Control Board, Los Angeles Region, finds:

1. United States Pipe and Foundry Company (a corporation), Concrete Pipe Division, discharges wastes under waste discharge requirements contained in Order No. 74-376 (NPDES Permit No. CA0001597), adopted by this Board on November 18, 1974. Order No. 74-376 expires on November 28, 1979.

2. United States Pipe and Foundry Company, Concrete Pipe Division, has filed a report of waste discharge and has applied for renewal of its waste discharge requirements and National Pollutant Discharge Elimination System permit.

3. United States Pipe and Foundry Company, Concrete Pipe Division, manufactures concrete and steel pipe at a facility located at 14041 East Live Oak Avenue, Irwindale, California, and discharges up to 3 million gallons per day of settled pond overflow consisting mostly of rainwater runoff to San Gabriel River, a water of the United States, at a point about 200 feet upstream from Live Oak Avenue, above the tidal prism.

   The discharge occurs only during and shortly after periods of heavy rainfall when the storage capacity of the pond is exceeded.

   The settling pond receives a mixture of wastewaters from concrete curing, washdown of concrete pouring areas and equipment, single-pass non-contact compressor cooling water, boiler blowdown, water softener regeneration brine, steam condensate, and rainfall runoff. Most of the yard work areas are paved, and these wastewaters and runoff flow to the settling pond for removal of suspended solids and recycling of the pumped water.

8/27/79

4. All the sanitary wastewater from the facility is disposed of onsite by means of a private sewage disposal system consisting of a septic tank and leach field. No community sewer system is available.

5. Waste discharge requirements for disposal of wastes by percolation are prescribed in separate (non-NPDES) Board requirements.

6. The sediment accumulated in the settling pond is periodically removed and disposed of to a legal disposal site.

7. The Board adopted a revised Water Quality Control Plan for Los Angeles River Basin on November 27, 1975. The Plan contains water quality objectives for San Gabriel River. The requirements contained in this Order are, or will be in conformance with the goals of the Water Quality Control Plan.

8. The beneficial uses of the receiving waters are: water contact and non-water contact recreation; warm and cold freshwater habitat and wildlife habitat; groundwater recharge; and (within the tidal prism) industrial service supply; ocean commercial and sport fishing; preservation of rare and endangered species; marine habitat; and saline water habitat.

9. Effluent limitation standards established pursuant to Section 301 of the Federal Water Pollution Control Act and amendments thereto are applicable to the discharge.

10. The issuance of waste discharge requirements for this discharge is exempt from the provisions of Chapter 3 (commencing with Section 21000) of Division 13 of the Public Resources Code in accordance with Water Code Section 13389.

TENTATIVE

The Board has notified the discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

The Board in a public hearing heard and considered all comments pertaining to the discharge and to the tentative requirements.

This Order shall serve as a National Pollutant Discharge Elimination System permit pursuant to Section 402 of the Federal Water Pollution Control Act, or amendments thereto, and shall take effect at the end of ten days from the date of its adoption, provided the Regional Administrator, EPA, has no objections.

IT IS HEREBY ORDERED, that United States Pipe and Foundry Company, Concrete Pipe Division, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Federal Water Pollution Control Act and regulations and guidelines adopted thereunder, shall comply with the following:

TENTATIVE

A. Effluent Limitations

1. The discharge of an effluent in excess of the following limits is prohibited:

Constituent	Units	Discharge Limitations Maximum
Oil and grease	mg/l	15
	lbs/day*	375
Total dissolved solids	mg/l	750
	lbs/day*	18,770
Turbidity	NTU	75

2. The daily discharge rate shall be obtained from the following calculation for any calendar day:

$$\text{Daily discharge rate} = \frac{8.34}{N} \sum_{1}^{N} Q_i C_i$$

in which N is the number of samples analyzed in any calendar day. Q_i and C_i are the flow rate (MGD) and the constituent concentration (mg/l) respectively, which are associated with each of the N grab samples which may be taken in any calendar day. If a composite sample is taken, C_i is the concentration measured in the composite sample and Q_i is the average flow rate occurring during the period over which samples are composited.

* Based on a maximum flow of 5 million gallons per day.

3. The 30-day average shall be the arithmetic average of all the daily values calculated using the results of analyses of all samples collected during any 30 consecutive calendar day period. If fewer than four samples are collected and analyzed during any 30 consecutive calendar day period, compliance with the 30-day average limitation shall not be determined.

4. The pH of wastes discharged shall at all times be within the range 6.0 to 9.0.

5. The temperature of wastes discharged shall not exceed 100°F.

6. Wastes discharged shall not contain visible oil or grease, and shall not cause the appearance of grease, oil or oily slick, or persistent foam in the receiving waters or on channel banks, walls, inverts or other structures.

7. Wastes discharged shall not cause the formation of sludge deposits.

8. Neither the disposal nor any handling of waste shall cause pollution or nuisance.

9. Wastes discharged shall not damage flood control structures or facilities.

10. This discharge shall not cause a violation of any applicable water quality standard for receiving waters adopted by the Regional Board or the State Water Resources Control Board as required by the Federal Water Pollution Control Act and regulations adopted thereunder. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Federal Water Pollution Control Act, or amendments thereto, the Board will revise and modify this Order in accordance with such more stringent standards.

11. Wastes discharged shall not contain any substances in concentrations toxic to human, animal, plant, or aquatic life.

12. Oil or oily materials, chemicals, refuse, sewerage, or other pollutionable materials shall not be stored or deposited in areas where they may be picked up by rainfall and carried off of this property or discharged to surface waters.

TENTATIVE

B. Provisions

1. This Order includes the following items of the attached "Standard Provisions": 1, 2, 4, 5, 6, 7, 8, 9, and 14.

2. This Order includes the following items of the attached "Reporting Requirements": C and D.

3. This Order includes the attached "General Monitoring and Reporting Provisions."

4. This Order expires on September 30, 1984, and the discharger must file a Report of Waste Discharge in accordance with Title 23, California Administrative Code, not later than 180 days in advance of such date as application for issuance of new waste discharge requirements.

5. A copy of these waste discharge specifications shall be maintained at the discharge facility so as to be available at all times to operating personnel.

6. In the event of any change in name, ownership, or control of these waste disposal facilities, the discharger shall notify this Board of such change and shall notify the succeeding owner or operator of the existence of this Order by letter, copy of which shall be forwarded to the Board.

7. Any discharge of wastes at any point(s) other than specifically described in this permit is prohibited, and constitutes a violation of the permit.

8. This order may be modified, or, alternatively, revoked and reissued, to comply with any applicable effluent limitation issued pursuant to the order the United States District Court for the District of Columbia issued on June 8, 1976, in Natural Resources Defense Council, Inc. et al. v. Russell E. Train, 8 ERC 2120 (U.S.D.C. 1976), if the effluent limitation so issued:

   (1) is different in conditions or more stringent than any effluent limitation in this order; or

   (2) controls any pollutant not limited in this order.

9. These requirements do not exempt the operator of this waste disposal facility from compliance with any other laws, regulations, or ordinances which may be applicable; they do not legalize this waste disposal facility, and they leave unaffected any further restrictions on the discharge of wastes at this site which may be imposed by other agencies or required by other agencies.

10. Order No. 74-57, adopted by this Board on November 18, 1974, is hereby rescinded.

TENTATIVE

Any comments that any person has with respect to these tentative requirements must be received by September 10, 1979, in order to be included in the Board's agenda folder.

With respect to the public notice, in accordance with the Federal Water Pollution Control Act, as amended in 1977, and the California Administrative Code, you are required to follow the enclosed instructions for publication or posting of the notice.

Failure to publish or post the notice will prevent the adoption of waste discharge requirements; to discharge without requirements subjects you to civil penalties of up to $10,000 for each day in which such discharge occurs. Failure to publish or post the notice will force us to reschedule this item for a later hearing and will require the publication or posting of a second notice. Please notify this Board by telephone when the notice has been published or posted and submit the proof of publication or posting as required in the enclosed instructions. Proof of posting or publication of the notice must be submitted to the Executive Officer of this Regional Board by September 8, 1979.

If you have any questions, please call us.

Very truly yours,

RAYMOND M. HERTEL
Executive Officer

RE: Tentative Waste Discharge Requirements (NPDES Permit CA0001597)

Gentlemen:

Reference is made to your completed application to this Board for a permit to discharge wastes under the National Pollutant Discharge Elimination System (NPDES).

Pursuant to the Federal Water Pollution Control Act, as amended in 1977, and in accordance with the California Administrative Code, tentative waste discharge requirements have been prepared.

Enclosed are copies of the following:

1. Tentative requirements, consisting of:
   a. Board Order
   b. Standard Provisions
   c. Reporting Requirements
   d. General Monitoring and Reporting Provisions
   e. Monitoring and Reporting Program
2. Instruction sheet for Public Notice
3. Public Notice (5 copies)
4. Statement of Posting Notice

In accordance with administrative procedures, this Board at a public hearing to be held on September 24,1979, at 10:00 a.m., 107 South Broadway, Room 1138, Los Angeles, California, will consider the enclosed tentative requirements and comments submitted in writing regarding any or all portions thereof. The Board will hear any testimony pertinent to this discharge and the tentative requirements. It is expected that the Board will take action at the hearing; however, as testimony indicates, the Board at its discretion may order further investigation.

RE: Tentative Waste Discharge Requirements (File 55-71)

Gentlemen:

Reference is made to your current waste discharge requirements for your Irwindale facility contained in Resolution No. 1056 adopted by this Board.

Investigation of this waste discharge has been made, and based upon this investigation tentative requirements have been prepared for any discharge to ground through your unlined settling pond. Waste discharge requirements for the settling pond overflow are prescribed in a separate (NPDES) Board requirements.

Enclosed are copies of the tentative requirements and specifications for technical reports to be submitted periodically to the Board.

In accordance with administrative procedures, this Board, at a public meeting to be held on September 24, 1979, at 10:00 a.m., 107 South Broadway, Room 1138, Los Angeles, California, will consider the enclosed tentative requirements and comments submitted in writing regarding any or all portions thereof. The Board will hear any testimony pertinent to this discharge and the tentative requirements. It is expected that the Board will take action at the meeting; however, as testimony indicates, the Board at its discretion may order further investigation.

Any comments that any person has with respect to these tentative requirements must be received by September 10, 1979, in order to be included in the Board's agenda folder.

If you have any questions, please call us.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO. 79-150

NPDES NO. CA0001597

WASTE DISCHARGE REQUIREMENTS FOR

UNITED STATES PIPE AND FOUNDRY COMPANY CONCRETE PIPE DIVISION

The California Regional Water Quality Control Board, Los Angeles Region, finds:

1. United States Pipe and Foundry Company (a corporation), Concrete Pipe Division, discharges wastes under waste discharge requirements contained in Order No. 74-376 (NPDES Permit No. CA0001597), adopted by this Board on November 18, 1974. Order No. 74-376 expires on November 28, 1979.

2. United States Pipe and Foundry Company, Concrete Pipe Division, has filed a report of waste discharge and has applied for renewal of its waste discharge requirements and National Pollutant Discharge Elimination System permit.

3. United States Pipe and Foundry Company, Concrete Pipe Division, manufactures concrete and steel pipe at a facility located at 14041 East Live Oak Avenue, Irwindale, California, and discharges up to 3 million gallons per day of settling pond overflow consisting mostly of rainwater runoff to San Gabriel River, a water of the United States, at a point about 200 feet upstream from Live Oak Avenue, above the tidal prism.

   The discharge occurs only during and shortly after periods of heavy rainfall when the storage capacity of the pond is exceeded.

   The settling pond receives a mixture of wastewaters from concrete curing, washdown of concrete pouring areas and equipment, single-pass non-contact compressor cooling water, boiler blowdown, water softener regeneration brine, steam condensate, and rainfall runoff. Most of the yard work areas are paved, and those wastewaters and runoff flow to the settling pond for removal of suspended solids and recycling of the ponded water.

Revised 9/6/79

4. All the sanitary wastewater from the facility is disposed of onsite by means of a private sewage disposal system consisting of a septic tank and leach field. No community sewer system is available.

5. Waste discharge requirements for disposal of wastes by percolation are prescribed in separate (non-NPDES) Board requirements.

6. The sediment accumulated in the settling pond is periodically removed and disposed of to a legal disposal site.

7. The Board adopted a revised Water Quality Control Plan for Los Angeles River Basin on November 27, 1978. The Plan contains water quality objectives for San Gabriel River. The requirements contained in this Order as they are met will be in conformance with the goals of the Water Quality Control Plan.

8. The beneficial uses of the receiving waters are: water contact and non-water contact recreation; warm and cold freshwater habitat and wildlife habitat; groundwater recharge; and (within the tidal prism) industrial service supply; ocean commercial and sport fishing; preservation of rare and endangered species; marine habitat; and saline water habitat.

9. Effluent limitation standards established pursuant to Section 301 of the Federal Water Pollution Control Act and amendments thereto are applicable to the discharge.

10. The issuance of waste discharge requirements for this discharge is exempt from the provisions of Chapter 3 (commencing with Section 21000) of Division 13 of the Public Resources Code in accordance with Water Code Section 13389.

The Board has notified the discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

The Board in a public hearing heard and considered all comments pertaining to the discharge and to the tentative requirements.

This Order shall serve as a National Pollutant Discharge Elimination System permit pursuant to Section 402 of the Federal Water Pollution Control Act, or amendments thereto, and shall take effect at the end of ten days from the date of its adoption, provided the Regional Administrator, EPA, has no objections.

IT IS HEREBY ORDERED, that United States Pipe and Foundry Company, Concrete Pipe Division, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Federal Water Pollution Control Act and regulations and guidelines adopted thereunder, shall comply with the following:

A. Effluent Limitations

1. The discharge of an effluent in excess of the following limits is prohibited:

Constituent	Units	Discharge Limitations Maximum
Oil and grease	mg/l	15
	lbs/day*	375

2. The daily discharge rate shall be obtained from the following calculation for any calendar day:

$$\text{Daily discharge rate} = \frac{8.34}{N} \sum_{1}^{N} Q_i \, C_i$$

in which N is the number of samples analyzed in any calendar day. Q_i and C_i are the flow rate (MGD) and the constituent concentration (mg/l) respectively, which are associated with each of the N grab samples which may be taken in any calendar day. If a composite sample is taken, C_i is the concentration measured in the composite sample and Q_i is the average flow rate occurring during the period over which samples are composited.

* Based on a maximum flow of 3 million gallons per day.

3. The 30-day average shall be the arithmetic average of all the daily values calculated using the results of analyses of all samples collected during any 30 consecutive calendar day period. If fewer than four samples are collected and analyzed during any 30 consecutive calendar day period, compliance with the 30-day average limitation shall not be determined.

4. The pH of wastes discharged shall at all times be within the range 6.0 to 9.0.

5. The temperature of wastes discharged shall not exceed 100°F.

6. Wastes discharged shall not contain visible oil or grease, and shall not cause the appearance of grease, oil or oily slick, or persistent foam in the receiving waters or on channel banks, walls, inverts or other structures.

7. Wastes discharged shall not cause the formation of sludge deposits.

8. Neither the disposal nor any handling of waste shall cause pollution or nuisance.

9. Wastes discharged shall not damage flood control structures or facilities.

10. This discharge shall not cause a violation of any applicable water quality standard for receiving waters adopted by the Regional Board or the State Water Resources Control Board as required by the Federal Water Pollution Control Act and regulations adopted thereunder. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Federal Water Pollution Control Act, or amendments thereto, the Board will revise and modify this Order in accordance with such more stringent standards.

11. Wastes discharged shall not contain any substances in concentrations toxic to human, animal, plant, or aquatic life.

12. Oil or oily material, chemicals, refuse, sweepings, or other pollutionable materials shall not be stored or deposited in areas where they may be picked up by rainfall and carried off of this property or discharged to surface waters.

13. Wastes discharged shall not increase the natural turbidity of the receiving waters.

Order

B. Provisions

1. This Order includes the following items of the attached "Standard Provisions": 1,2,4,5,6,7,8,9, and 11.

2. This Order includes the following items of the attached "Reporting Requirements": 1 and 5.

3. This Order includes the attached "General Monitoring and Reporting Provisions."

4. This Order expires on September 10, 1984, and the discharger must file a Report of Waste Discharge in accordance with Title 23, California Administrative Code, not later than 180 days in advance of such date as application for issuance of new waste discharge requirements.

5. A copy of these waste discharge specifications shall be maintained at the discharge facility so as to be available at all times to operating personnel.

6. In the event of any change in name, ownership, or control of these waste disposal facilities, the discharger shall notify this Board of such change and shall notify the succeeding owner or operator of the existence of this Order by letter, copy of which shall be forwarded to the Board.

7. Any discharge of wastes at any point(s) other than specifically described in this permit is prohibited, and constitutes a violation of the permit.

8. This order may be modified, or, alternatively, revoked and reissued, to comply with any applicable effluent limitation issued pursuant to the order the United States District Court for the District of Columbia issued on June 8, 1976, in Natural Resources Defense Council, Inc. et al. v. Russell E. Train, 8 ERC 2120 (D.D.C. 1976), if the effluent limitation so issued:

   (1) is different in conditions or more stringent than any effluent limitation in this order; or

   (2) controls any pollutant not limited in this order.

9. These requirements do not exempt the operator of this waste disposal facility from compliance with any other laws, regulations, or ordinances which may be applicable; they do not legalize this waste disposal facility, and they leave unaffected any further restraint on the disposal of wastes at this site which may be contained in other statutes or required by other agencies.

10. Order No. 74-376, adopted by this Board on November 18, 1974, is hereby rescinded.

I, Raymond M. Hertel, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on September 24, 1979.

Raymond M. Hertel

RAYMOND M. HERTEL, Executive Officer

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

CA 0001597

STANDARD PROVISIONS

1. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, nor protect the discharger from his liabilities under federal, state, or local laws, nor guarantee the discharger a capacity right in the receiving waters.

2. The discharge of any radiological, chemical, or biological warfare agent or high level radiological waste is prohibited.

3. The discharger shall require any industrial user of the treatment works to comply with applicable service charges and toxic and pretreatment standards promulgated in accordance with Sections 204(b), 307, and 308 of the Federal Water Pollution Control Act or amendments thereto. The discharger shall require each individual user to submit periodic notice (over intervals not to exceed nine months) of progress toward compliance with applicable toxic and pretreatment standards developed pursuant to the Federal Water Pollution Control Act or amendments thereto. The discharger shall forward a copy of such notice to the Board and the Regional Administrator.

4. The discharger shall permit the Regional Board:

   (a) Entry upon premises in which an effluent source is located or in which any required records are kept;

   (b) Access to copy any records required to be kept under terms and conditions of this Order;

   (c) Inspection of monitoring equipment or records, and

   (d) Sampling of any discharge.

5. All discharges authorized by this Order shall be consistent with the terms and conditions of this Order. The discharge of any pollutant more frequently than or at a level in excess of that identified and authorized by this Order shall constitute a violation of the terms and conditions of this Order.

6. The discharger shall maintain in good working order and operate as efficiently as possible any facility or control system installed by the discharger to achieve compliance with the waste discharge requirements.

7. Collected screening, sludges, and other solids removed from liquid wastes shall be disposed of at a legal point of disposal, and in accordance with the provisions of Division 7.5 of the California Water Code. For the purpose of this requirement, a legal point of disposal is defined as one for which waste discharge requirements have been prescribed by a regional water quality control board and which is in full compliance therewith.

8. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:

   (a) Violation of any term or condition contained in this Order;

   (b) Obtaining this Order by misrepresentation, or failure to disclose all relevant facts;

   (c) A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

9. If a toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standards or prohibition) is established under Section 307(a) of the Federal Water Pollution Control Act, or amendments thereto, for a toxic pollutant which is present in the discharge authorized herein and such standard or prohibition is more stringent than any limitation upon such pollutant in this Order, the Board will revise or modify this Order in accordance with such toxic effluent standard or prohibition and so notify the discharger.

10. There shall be no discharge of harmful quantities of oil or hazardous substances, as specified by regulation adopted pursuant to Section 311 of the Federal Water Pollution Control Act, or amendments thereto.

11. In the event the discharger is unable to comply with any of the conditions of this Order due to:

   (a) breakdown of waste treatment equipment;

   (b) accidents caused by human error or negligence; or

   (c) other causes such as acts of nature,

   the discharger shall notify the Executive Officer by telephone as soon as he or his agents have knowledge of the incident and confirm this notification in writing within two weeks of the telephone notification. The written notification shall include pertinent information explaining reasons for the non-compliance and shall indicate what steps were taken to correct the problem and the dates thereof, and what steps are being taken to prevent the problem from recurring.

12. Supervisors and operators of publicly owned wastewater treatment plants shall possess a certificate of appropriate grade in accordance with regulations adopted by the State Water Resources Control Board.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

REPORTING REQUIREMENTS

1. The discharger shall file with the Board technical reports on self-monitoring work performed according to the detailed specifications contained in any Monitoring and Reporting Programs as directed by the Executive Officer.

2. The discharger shall file a written report with the Board within 90 days after the average dry-weather waste flow for any month equals or exceeds 75 percent of the design capacity of his waste treatment and/or disposal facilities. The discharger's senior administrative officer shall sign a letter which transmits that report and certifies that the policy-making body is adequately informed about it. The report shall include:

   Average daily flow for the month, the date on which the instantantaneous peak flow occurred, the rate of that peak flow, and the total flow for that day.

   The discharger's best estimate of when the average daily dry-weather flow rate will equal or exceed the design capacity of his facilities.

   The discharger's intended schedule for studies, design, and other steps needed to provide additional capacity for his waste treatment and/or disposal facilities before the waste flow rate equals the capacity of present units. (Reference: Sections 13260, 13267(b), and 13268, California Water Code).

3. The discharger shall notify the Board not later than 120 days in advance of implementation of any plans to alter production capacity of the product line of the manufacturing, producing or processing facility by more than ten percent. Such notification shall include estimates of proposed production rate, the type of process, and projected effects on effluent quality. Notification shall include submittal of a new report of waste discharge and appropriate filing fee.

4. The discharger shall notify the Board of (a) new introduction into such works of pollutants from a source which would be a new source as defined in Section 306 of the Federal Water Pollution Control Act, or amendments thereto, if such source were discharging pollutants to the waters of the United States, (b) new introductions of pollutantsinto such works from a source which would be subject to Section 301 of the Federal Water Pollution Control Act, or amendments thereto, if substantial change in the volume or character of pollutants being introduced into such works by a source introducing pollutants into such works at the time the waste discharge requirements were adopted. Notice shall include a description of the quantity and quality of pollutants and the impact of such change on the substantial change in volume is considered an increase of ten percent in the mean dry-weather flow rate. The discharger shall forward a copy of such notice directly to the Regional Administrator.

5. The discharger shall file with the Board a report on waste discharge at least 120 days before making any material change or proposed change in the character, location or volume of the discharge.

6. This Board requires the discharger to file with the Board, within 90 days after the effective date of this Order, a technical report on his preventive (failsafe) and contingency (cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events. The technical report should:

   Identify the possible sources of accidental loss, untreated waste bypass, and contaminated drainage. Loading and storage areas, power outage, waste treatment unit outage, and failure of process equipment, tanks and pipes should be considered.

   Evalulate the effectiveness of present facilities and procedures and state when they became operational.

   Describe facilities and procedures needed for effective preventive and contingency plans.

   Predict the effectiveness of the proposed facilities and procedures and provide an implementation schedule containing interim and final dates when they will be constructed, implemented, or operational. (Reference: Sections 13267(b) and 13268, California Water Code.

   This Board, after review of the technical report, may establish conditions which it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions may be incorporated as part of this Order, upon notice to the discharger.

7. The discharger shall submit to the Board, by January 30 of each year, an annual summary of the quantities of all chemicals, listed by both trade and chemical names, which are used for cooling and/or boiler water treatment and which are discharged.

8. The discharger shall submit to the Board, together with the first monitoring report required by this permit, a list of all chemicals and proprietary additives which could affect this waste discharge, including quantities of each. Any subsequent changes in types and/or quantities shall be reported promptly.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

GENERAL MONITORING AND REPORTING PROVISIONS

GENERAL PROVISIONS FOR SAMPLING AND ANALYSIS

All sampling, sample preservation, and analyses shall be performed in accordance with the latest edition of "Guidelines Establishing Test Procedures for Analysis of Pollutants", promulgated by the United States Environmental Protection Agency.

All chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by the State Department of Health.

Effluent samples shall be taken downstream of any addition to the treatment works and prior to mixing with the receiving waters.

The discharger shall calibrate and perform maintenance procedures on all monitoring instruments and equipment to insure accuracy of measurements, or shall insure that both activities will be conducted.

A grab sample is defined as an individual sample collected in fewer than 15 minutes.

A composite sample is defined as a combination of no fewer than eight individual samples obtained over the specified sampling period. The volume of each individual sample is proportional to the discharge flow rate at the time of sampling. The sampling period shall equal the discharge period, or 24 hours, whichever period is shorter.

GENERAL PROVISIONS FOR REPORTING

For every item where the requirements are not met, the discharger shall submit a statement of the actions undertaken or proposed which will bring the discharge into full compliance with requirements at the earliest time and submit a timetable for correction.

By January 30 of each year, the discharger shall submit an annual report to the Board. The report shall contain both tabular and graphical summaries of the monitoring data obtained during the previous year. In addition, the discharger shall discuss the compliance record and the corrective actions taken or planned which may be needed to bring the discharge into full compliance with the waste discharge requirements.

The discharger shall maintain all sampling and analytical results, including strip charts; date, exact place, and time of sampling; date analyses were performed; analyst's name, analytical techniques used; and results of all analyses. Such records shall be retained for a minimum of three years. This period of retention shall be extended during the course of any unresolved litigation regarding this discharge or when requested by the Board.

(Revised 9/19/77)

In reporting the monitoring data, the discharger shall arrange the data in tabular form so that the date, the constituents, and the concentrations are readily discernible. The data shall be summarized to demonstrate compliance with waste discharge requirements and, where applicable, shall include results of receiving water observations.

Monitoring reports shall be signed by:

a. In the case of corporations, by a principal executive officer at least of the level of vice-president or his duly authorized representative, if such representative is responsible for the overall operation of the facility from which discharge originates;

b. In the case of a partnership, by a general partner;

c. In the case of a sole proprietorship, by the proprietor;

d. In the case of municipal, state or other public facility, by either a principal executive officer, ranking elected official, or other duly authorized employee.

Each report shall contain the following completed declaration:

"I declare under penalty of perjury that the foregoing is true and correct.

Executed on the _____ day of _____ at _____.

_____(Signature)

_____(Title)"

The discharger shall mail a copy of each monitoring report to the following:

California Regional Water Quality
Control Board - Los Angeles Region
107 South Broadway, Room 4027
Los Angeles, CA 90012

ATTN: Executive Officer

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION
MONITORING AND REPORTING PROGRAM NO. 56
FOR
UNITED STATES PIPE AND FOUNDRY COMPANY
Concrete Pipe Division
(CA0001597)

The discharger shall implement this monitoring program on the effective date of this Order. The first monitoring report under this program is due January 15, 1980.

Monitoring reports shall be submitted by the dates in the following schedule:

Reporting Period	Report Due
January - March	April 15
April - June	July 15
July - September	October 15
October - December	January 15

If no flow occurred during the quarter the report shall so state.

Each monitoring report must affirm in writing that:

> All analyses were conducted at a laboratory certified for such analyses by the State Department of Health Services in accordance with current EPA guideline procedures or as specified in the Monitoring Program.

For any analysis performed for which no procedure is specified in the EPA guidelines or in this Monitoring Program, the constituent or parameter analyzed and the method or procedure used must be specified in the report.

The report shall state whether there was any change in the discharge as described in the application, during the reporting period.

Effluent Monitoring

A sampling station shall be established for each point of discharge and shall be located where representative samples of that effluent can be obtained. The following shall constitute the effluent monitoring program:

Constituent	Units	Type of Sample	Minimum Frequency of Analysis*
pH	pH units	grab	once per discharge event
Temperature	^{o}F	grab	once per discharge event
Total waste flow	gal/day	----	once per discharge day
Oil and grease	mg/l	grab	once per discharge event
Turbidity	NTU	grab	once per discharge event

* Samples shall be taken during the first hour of discharge. No more than one sample per month is required during periods of extended rainfall.

Ordered by Roger W. Kent
Executive Officer

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO._____

NPDES NO. CA0001597

WASTE DISCHARGE REQUIREMENTS
FOR

UNITED STATES PIPE AND FOUNDRY COMPANY
CONCRETE PIPE DIVISION

TENTATIVE

The California Regional Water Quality Control Board, Los Angeles Region, finds:

1. United States Pipe and Foundry Company (a corporation), Concrete Pipe Division, discharges wastes under waste discharge requirements contained in Order No. 74-376 (NPDES Permit No. CA0001597), adopted by this Board on November 18, 1974. Order No. 74-376 expires on November 28, 1979.

2. United States Pipe and Foundry Company, Concrete Pipe Division, has filed a report of waste discharge and has applied for renewal of its waste discharge requirements and National Pollutant Discharge Elimination System permit.

3. United States Pipe and Foundry Company, Concrete Pipe Division, manufactures concrete and steel pipe at a facility located at 14041 East Live Oak Avenue, Irwindale, California, and discharges up to 3 million gallons per day of settling pond overflow consisting mostly of rainwater runoff to San Gabriel River, a water of the United States, at a point about 200 feet upstream from Live Oak Avenue, above the tidal prism.

   The discharge occurs only during and shortly after periods of heavy rainfall when the storage capacity of the pond is exceeded.

   The settling pond receives a mixture of wastewaters from concrete curing, washdown of concrete pouring areas and equipment, single-pass non-contact compressor cooling water, boiler blowdown, water softener regeneration brine, steam condensate, and rainfall runoff. Most of the yard work areas are paved, and those wastewaters and runoff flow to the settling pond for removal of suspended solids and recycling of the ponded water.

Revised 9/6/79

8/23/79

The Board has notified the discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

The Board in a public hearing heard and considered all comments pertaining to the discharge and to the tentative requirements.

This Order shall serve as a National Pollutant Discharge Elimination System permit pursuant to Section 402 of the Federal Water Pollution Control Act, or amendments thereto, and shall take effect at the end of ten days from the date of its adoption, provided the Regional Administrator, EPA, has no objections.

IT IS HEREBY ORDERED, that United States Pipe and Foundry Company, Concrete Pipe Division, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Federal Water Pollution Control Act and regulations and guidelines adopted thereunder, shall comply with the following:

TENTATIVE

A. Effluent Limitations

1. The discharge of an effluent in excess of the following limits is prohibited:

Constituent	Units	Discharge Limitations Maximum
Oil and grease	mg/l	15
	lbs/day*	375

2. The daily discharge rate shall be obtained from the following calculation for any calendar day:

$$\text{Daily discharge rate} = \frac{8.34}{N} \sum_{1}^{N} Q_i C_i$$

in which N is the number of samples analyzed in any calendar day. Q_i and C_i are the flow rate (MGD) and the constituent concentration (mg/l) respectively, which are associated with each of the N grab samples which may be taken in any calendar day. If a composite sample is taken, C_i is the concentration measured in the composite sample and Q_i is the average flow rate occurring during the period over which samples are composited.

* Based on a maximum flow of 3 million gallons per day.

3. The 30-day average shall be the arithmetic average of all the daily values calculated using the results of analyses of all samples collected during any 30 consecutive calendar day period. If fewer than four samples are collected and analyzed during any 30 consecutive calendar day period, compliance with the 30-day average limitation shall not be determined.

4. The pH of wastes discharged shall at all times be within the range 6.0 to 9.0.

5. The temperature of wastes discharged shall not exceed 100°F.

6. Wastes discharged shall not contain visible oil or grease, and shall not cause the appearance of grease, oil or oily slick, or persistent foam in the receiving waters or on channel banks, walls, inverts or other structures.

7. Wastes discharged shall not cause the formation of sludge deposits.

8. Neither the disposal nor any handling of waste shall cause pollution or nuisance.

9. Wastes discharged shall not damage flood control structures or facilities.

10. This discharge shall not cause a violation of any applicable water quality standard for receiving waters adopted by the Regional Board or the State Water Resources Control Board as required by the Federal Water Pollution Control Act and regulations adopted thereunder. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Federal Water Pollution Control Act, or amendments thereto, the Board will revise and modify this Order in accordance with such more stringent standards.

11. Wastes discharged shall not contain any substances in concentrations toxic to human, animal, plant, or aquatic life.

12. Oil or oily material, chemicals, refuse, sweepings, or other pollutionable materials shall not be stored or deposited in areas where they may be picked up by rainfall and carried off of this property or discharged to surface waters.

13. Wastes discharged shall not increase the natural turbidity of the receiving waters.

TENTATIVE

LOS ANGELES REGION

MONITOR[redacted] AND REPORTING PROGRAM NO. [redacted]

FOR

UNITED STATES PIPE AND FOUNDRY COMPANY
Concrete Pipe Division
(CA0001597)

The discharger shall implement this monitoring program on the effective date of this Order. The first monitoring report under this program is due January 15, 1980.

Monitoring reports shall be submitted by the dates in the following schedule:

Reporting Period	Report Due
January - March	April 15
April - June	July 15
July - September	October 15
October - December	January 15

If no flow occurred during the quarter the report shall so state.

Each monitoring report must affirm in writing that:

All analyses were conducted at a laboratory certified for such analyses by the State Department of Health Services in accordance with current EPA guideline procedures or as specified in the Monitoring Program.

For any analysis performed for which no procedure is specified in the EPA guidelines or in this Monitoring Program, the constituent or parameter analyzed and the method or procedure used must be specified in the report.

The report shall state whether there was any change in the discharge as described in the application, during the reporting period.

Effluent Monitoring

A sampling station shall be established for each point of discharge and shall be located where representative samples of that effluent can be obtained. The following shall constitute the effluent monitoring program:

Constituent	Units	Type of Sample	Minimum Frequency of Analysis*
pH	pH units	grab	once per discharge event
Temperature	°F	grab	once per discharge event
Total waste flow	gal/day	---	once per discharge day
Oil and grease	mg/l	grab	once per discharge event
Turbidity	NTU	grab	once per discharge event

* Samples shall be taken during the first hour of discharge. No more than one sample per month is required during periods of extended rainfall.

Ordered by _____
Executive Officer

_____
Date

STANDARD PROVISIONS

TENTATIVE

1. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, nor protect the discharger from his liabilities under federal, state, or local laws, nor guarantee the discharger a capacity right in the receiving waters.

2. The discharge of any radiological, chemical, or biological warfare agent or high level radiological waste is prohibited.

3. The discharger shall require any industrial user of the treatment works to comply with applicable service charges and toxic and pretreatment standards promulgated in accordance with Sections 204(b), 307, and 308 of the Federal Water Pollution Control Act or amendments thereto. The discharger shall require each individual user to submit periodic notice (over intervals not to exceed nine months) of progress toward compliance with applicable toxic and pretreatment standards developed pursuant to the Federal Water Pollution Control Act or amendments thereto. The discharger shall forward a copy of such notice to the Board and the Regional Administrator.

4. The discharger shall permit the Regional Board:

   (a) Entry upon premises in which an effluent source is located or in which any required records are kept;

   (b) Access to copy any records required to be kept under terms and conditions of this Order;

   (c) Inspection of monitoring equipment or records, and

   (d) Sampling of any discharge.

5. All discharges authorized by this Order shall be consistent with the terms and conditions of this Order. The discharge of any pollutant more frequently than or at a level in excess of that identified and authorized by this Order shall constitute a violation of the terms and conditions of this Order.

6. The discharger shall maintain in good working order and operate as efficiently as possible any facility or control system installed by the discharger to achieve compliance with the waste discharge requirements.

7. Collected screening, sludges, and other solids removed from liquid wastes shall be disposed of at a legal point of disposal, and in accordance with the provisions of Division 7.5 of the California Water Code. For the purpose of this requirement, a legal point of disposal is defined as one for which waste discharge requirements have been prescribed by a regional water quality control board and which is in full compliance therewith.

8. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:

   (a) Violation of any term or condition contained in this Order;

   (b) Obtaining this Order by misrepresentation, or failure to disclose all relevant facts;

   (c) A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

9. If a toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standards or prohibition) is established under Section 307(a) of the Federal Water Pollution Control Act, or amendments thereto, for a toxic pollutant which is present in the discharge authorized herein and such standard or prohibition is more stringent than any limitation upon such pollutant in this Order, the Board will revise or modify this Order in accordance with such toxic effluent standard or prohibition and so notify the discharger.

10. There shall be no discharge of harmful quantities of oil or hazardous substances, as specified by regulation adopted pursuant to Section 311 of the Federal Water Pollution Control Act, or amendments thereto.

11. In the event the discharger is unable to comply with any of the conditions of this Order due to:

   (a) breakdown of waste treatment equipment;

   (b) accidents caused by human error or negligence; or

   (c) other causes such as acts of nature,

   the discharger shall notify the Executive Officer by telephone as soon as he or his agents have knowledge of the incident and confirm this notification in writing within two weeks of the telephone notification. The written notification shall include pertinent information explaining reasons for the non-compliance and shall indicate what steps were taken to correct the problem and the dates thereof, and what steps are being taken to prevent the problem from recurring.

12. Supervisors and operators of publicly owned wastewater treatment plants shall possess a certificate of appropriate grade in accordance with regulations adopted by the State Water Resources Control Board

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

TENTATIVE

REPORTING REQUIREMENTS

1. The discharger shall file with the Board technical reports on self-monitoring work performed according to the detailed specifications contained in any Monitoring and Reporting Programs as directed by the Executive Officer.

2. The discharger shall file a written report with the Board within 90 days after the average dry-weather waste flow for any month equals or exceeds 75 percent of the design capacity of his waste treatment and/or disposal facilities. The discharger's senior administrative officer shall sign a letter which transmits that report and certifies that the policy-making body is adequately informed about it. The report shall include:

   Average daily flow for the month, the date on which the instantantaneous peak flow occurred, the rate of that peak flow, and the total flow for that day.

   The discharger's best estimate of when the average daily dry-weather flow rate will equal or exceed the design capacity of his facilities.

   The discharger's intended schedule for studies, design, and other steps needed to provide additional capacity for his waste treatment and/or disposal facilities before the waste flow rate equals the capacity of present units. (Reference: Sections 13260, 13267(b), and 13268, California Water Code).

3. The discharger shall notify the Board not later than 120 days in advance of implementation of any plans to alter production capacity of the product line of the manufacturing, producing or processing facility by more than ten percent. Such notification shall include estimates of proposed production rate, the type of process, and projected effects on effluent quality. Notification shall include submittal of a new report of waste discharge and appropriate filing fee.

4. The discharger shall notify the Board of (a) new introduction into such works of pollutants from a source which would be a new source as defined in Section 306 of the Federal Water Pollution Control Act, or amendments thereto, if such source were discharging pollutants to the waters of the United States, (b) new introductions of pollutantsinto such works from a source which would be subject to Section 301 of the Federal Water Pollution Control Act, or amendments thereto, if substantial change in the volume or character of pollutants being introduced into such works by a source introducing pollutants into such works at the time the waste discharge requirements were adopted. Notice shall include a description of the quantity and quality of pollutants and the impact of such change on the substantial change in volume is considered an increase of ten percent in the mean dry-weather flow rate. The discharger shall forward a copy of such notice directly to the Regional Administrator.

5. The discharger shall file with the Board a report on waste discharge at least 120 days before making any material change or proposed change in the character, location or volume of the discharge.

6. This Board requires the discharger to file with the Board, within 90 days after the effective date of this Order, a technical report on his preventive (failsafe) and contingency (cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events. The technical report should:

   Identify the possible sources of accidental loss, untreated waste bypass, and contaminated drainage. Loading and storage areas, power outage, waste treatment unit outage, and failure of process equipment, tanks and pipes should be considered.

   Evalulate the effectiveness of present facilities and procedures and state when they became operational.

   Describe facilities and procedures needed for effective preventive and contingency plans.

   Predict the effectiveness of the proposed facilities and procedures and provide an implementation schedule containing interim and final dates when they will be constructed, implemented, or operational. (Reference: Sections 13267(b) and 13268, California Water Code.

   This Board, after review of the technical report, may establish conditions which it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions may be incorporated as part of this Order, upon notice to the discharger.

7. The discharger shall submit to the Board, by January 30 of each year, an annual summary of the quantities of all chemicals, listed by both trade and chemical names, which are used for cooling and/or boiler water treatment and which are discharged.

8. The discharger shall submit to the Board, together with the first monitoring report required by this permit, a list of all chemicals and proprietary additives which could affect this waste discharge, including quantities of each. Any subsequent changes in types and/or quantities shall be reported promptly.

CA0001597

TENTATIVE

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

GENERAL MONITORING AND REPORTING PROVISIONS

GENERAL PROVISIONS FOR SAMPLING AND ANALYSIS

All sampling, sample preservation, and analyses shall be performed in accordance with the latest edition of "Guidelines Establishing Test Procedures for Analysis of Pollutants", promulgated by the United States Environmental Protection Agency.

All chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by the State Department of Health.

Effluent samples shall be taken downstream of any addition to the treatment works and prior to mixing with the receiving waters.

The discharger shall calibrate and perform maintenance procedures on all monitoring instruments and equipment to insure accuracy of measurements, or shall insure that both activities will be conducted.

A grab sample is defined as an individual sample collected in fewer than 15 minutes.

A composite sample is defined as a combination of no fewer than eight individual samples obtained over the specified sampling period. The volume of each individual sample is proportional to the discharge flow rate at the time of sampling. The sampling period shall equal the discharge period, or 24 hours, whichever period is shorter.

GENERAL PROVISIONS FOR REPORTING

For every item where the requirements are not met, the discharger shall submit a statement of the actions undertaken or proposed which will bring the discharge into full compliance with requirements at the earliest time and submit a timetable for correction.

By January 30 of each year, the discharger shall submit an annual report to the Board. The report shall contain both tabular and graphical summaries of the monitoring data obtained during the previous year. In addition, the discharger shall discuss the compliance record and the corrective actions taken or planned which may be needed to bring the discharge into full compliance with the waste discharge requirements.

The discharger shall maintain all sampling and analytical results, including strip charts; date, exact place, and time of sampling; date analyses were performed; analyst's name; analytical techniques used; and results of all analyses. Such records shall be retained for a minimum of three years. This period of retention shall be extended during the course of any unresolved litigation regarding this discharge or when requested by the Board.

(Revised 8/4/75)

TENTATIVE

In reporting the monitoring data, the discharger shall arrange the data in tabular form so that the date, the constituents, and the concentrations are readily discernible. The data shall be summarized to demonstrate compliance with waste discharge requirements and, where applicable, shall include results of receiving water observations.

Monitoring reports shall be signed by:

a. In the case of corporations, by a principal executive officer at least of the level of vice-president or his duly authorized representative, if such representative is responsible for the overall operation of the facility from which discharge originates;

b. In the case of a partnership, by a general partner;

c. In the case of a sole proprietorship, by the proprietor;

d. In the case of municipal, state or other public facility, by either a principal executive officer, ranking elected official, or other duly authorized employee.

Each report shall contain the following completed declaration:

"I declare under penalty of perjury that the foregoing is true and correct.

Executed on the _____ day of _____ at _____.

_____(Signature)

_____(Title)"

The discharger shall mail a copy of each monitoring report to the following:

RE: Tentative Waste Discharge Requirements
(File No. 55-71)

Gentlemen:

Reference is made to our letter of August 27, 1979, which transmitted a copy of tentative waste discharge requirements for the discharge to ground through your unlined settling pond. You were informed that these requirements would be considered by the Board at its September 24, 1979, meeting.

The County Engineer's office has decided they will issue an updated Industrial Waste permit for this discharge. Therefore, we are withdrawing these tentative waste discharge requirements; they will not be presented to the Board for consideration at the September 24, 1979, meeting. We will recommend instead that the Board at some future date adopt pertinent conditions and limitations in the County permit as the Board's requirements.

If you have any questions, please call Dennis Dasker at the above number.

Very truly yours,

RAYMOND M. HERTEL
Executive Officer

RE: Tentative Waste Discharge Requirements (NPDES Permit No. CA0001597)

Gentlemen:

Reference is made to our letter of August 24, 1979, which transmitted a copy of tentative renewal waste discharge requirements for surface discharge and informed you they would be considered by the Board at its September 24, 1979, hearing.

We have revised the tentative effluent limitations to delete the limitations for total dissolved solids and turbidity as they are not appropriate for this storm water discharge. Please replace the original pages with the enclosed revised pages 3, 4 and F-1.

The revised tentative requirements will still be considered by the Board at its September 24, 1979, hearing.

If you have any questions, please call us.

Very truly yours,

RAYMOND M. HERTEL
Executive Officer

RE: Waste Discharge Requirements (NPDES Permit No. CA0001597)

Gentlemen:

Reference is made to our letter dated August 24, 1979, **which transmitted a draft of tentative requirements for your disposal of** settling pond overflow.

Pursuant to Division 7 of the California Water Code, this California Regional Water Quality Control Board, at a public hearing held on September 24, 1979, **reviewed these tentative requirements, considered all factors in the case, and adopted Order No.** 79-150 **(copy attached) relative to this waste discharge. This Order serves as a permit under the National Pollutant Discharge Elimination System, and expires** September 10, 1984. **Please note that you must file an application for a new permit at least 180 days in advance of that date.**

You are required to implement the new monitoring program as stated in the Monitoring and Reporting Program on the effective date of this Order. Please note that any monitoring report due under your previous Monitoring and Reporting Program is still required and must be submitted by the due date. Please reference all technical and monitoring reports to our Compliance File No. 1058. **We would appreciate it if you would not combine other reports, such as progress or technical reports, with your monitoring reports but would submit each type of report as a separate document.**

Very truly yours,

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO._____

NPDES NO. CA0064920

WASTE DISCHARGE REQUIREMENTS FOR

[illegible]
UNITED CONCRETE PIPE DIVISION

The California Regional Water Quality Control Board, Los Angeles Region, finds:

1. [illegible]

2. [illegible]

3. United States Pipe and Foundry Company, United Concrete Pipe Division, [illegible] manufactures concrete pipe at a facility located at 14011 East Live Oak Avenue, Irwindale, California, and discharges [illegible] of cooling water, boiler blowdown, water softener regeneration brine, floor washdown, and rainfall runoff. Most of the process water is purged, and those wastewaters [illegible] runoff flow to the unlined pond for percolation and recycling of the ground water.

-1-

4. All the sanitary wastewater from the facility is disposed of [illegible] and is not discharged to surface waters. [illegible] and is potable. No community sewage system is available.

5. Waste discharge requirements for disposal of wastes by percolation were prescribed in Order (Order 81-82) Board requirements.

6. The sediment accumulated in the retention pond is periodically removed and disposed of at a legal [illegible] site.

7. [illegible] Water Code Section [illegible] The [illegible] water quality control [illegible] The requirements contained in this Order [illegible] with the goals of the Water Quality Control Plan.

8. The beneficial uses of the receiving waters are: [illegible] and non-water contact recreation; [illegible] habitat; and wildlife [illegible]; and (with the [illegible] The [illegible] may be [illegible] [illegible] [illegible]

The people have participated in this hearing and the general operation and [illegible] of the [illegible] in the area discharge [illegible] and have provided [illegible] an opportunity to submit their written views and recommendations.

The Board in a public hearing has held and considered all comments pertaining to the discharge and to the tentative requirements.

This Order shall serve as a National Pollutant Discharge Elimination System permit pursuant to Section 402 of the Federal Water Pollution Control Act, or amendments thereto, and shall take effect at the end of ten days from the date of its adoption, provided the Regional Administrator, EPA, has no objection.

It is hereby ordered that [illegible] in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Federal Water Pollution Control Act and regulations and guidelines adopted thereunder, shall comply with the following:

A. Effluent limitations

1. [illegible]

2. [illegible]

Constituent	Units	Discharge Limitation Monthly
Oil and grease	mg/l	15
	lbs/day	213

[illegible]

[illegible]

[illegible]

[illegible] shall not exceed [illegible] mg/l. [

4. The pH of wastes discharged shall at all times be within the range 6.0 to 9.0.

5. The temperature of wastes discharged shall not exceed 100°F.

6. Wastes discharged shall not contain visible oil or grease, and shall not cause the appearance of oil, oil or oily sheen, or persistent foam in the receiving waters or on adjacent beaches, walls, inlets or other shorelines.

7. Wastes discharged shall not cause the formation of sludge deposits.

8. Neither the disposal nor any handling of waste shall cause pollution or nuisance.

9. Wastes discharged shall not damage flood control structures or facilities.

10. This discharge shall not cause a violation of any applicable water quality standard for receiving waters adopted by the Regional Board or the State Water Resources Control Board as required by the Federal Water Pollution Control Act and amendments thereto. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 307 of the Federal Water Pollution Control Act, or amendments thereto, the Board will review and modify this Order in accordance with such more stringent standards.

11. Wastes discharged shall not contain any substances in concentrations toxic to human, animal, plant, or aquatic life.

12. Oil or oily material, chemicals, refuse, or other pollutants from cleaning, fueling, or servicing operations shall not be allowed to enter or be placed where they will enter waters of the State by runoff, unless adequate disposal facilities or other protection is provided.

13. Wastes shall not cause the natural turbidity of the receiving waters.

It is ordered that:

1. This Order includes the following items of the attached "Standard Provisions": 1,2,4,5,6,7,8, and 9.

2. This Order includes the following items of the attached "Reporting Requirements": 1 and 2.

3. This Order includes the attached "General Monitoring and Reporting Requirements".

4. This Order supersedes Waste Discharge Requirements Order No. [illegible] adopted by the Board on [illegible]. Upon the effective date of this Order, the requirements contained in said Order are no longer in effect except for enforcement purposes.

5. A copy of these waste discharge requirements shall be maintained at the discharge facility so as to be available at all times to operating personnel.

6. In the event of any change in name, ownership or control of these waste disposal facilities, the discharger shall notify the Board of such change and shall notify the succeeding owner or operator of the existence of these requirements by letter, a copy of which shall be forwarded to the Board.

7. [illegible] shall not be grounds for a reduction in the penalty or otherwise excuse the noncompliance or violation.

8. This order may be modified, or revoked, upon application or petition, to comply with any applicable effluent limitation [illegible] Order No. [illegible] as a result of the [illegible] data in support of [illegible] Natural Resources Defense Council, Inc. v. [illegible], F. [illegible] (D.C. Cir. [illegible]), or [illegible] such as a result of:

   (1) [illegible] or modification of more stringent [illegible] than those contained in this Order, or

   (2) controls any pollutant not limited in this order.

9. These requirements do not exempt the operator of this waste disposal facility from compliance with any other laws, regulations, or ordinances which may be applicable; they do not legalize this waste disposal facility, and they leave unaffected any further restrictions on the discharge of wastes at this site which may be contained in other statutes or required by other agencies.

State of California

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, LOS ANGELES REGION

ORDER NO. 84-70

NPDES NO. CA0001597

WASTE DISCHARGE REQUIREMENTS FOR

UNITED STATES PIPE AND FOUNDRY COMPANY
UNITED CONCRETE PIPE DIVISION

The California Regional Water Quality Control Board, Los Angeles Region, finds:

1. United States Pipe and Foundry Company (a corporation), United Concrete Pipe Division, discharges wastes under waste discharge requirements contained in Order No. 79-150 adopted by this Board on September 24, 1979.

2. United States Pipe and Foundry Company, United Concrete Pipe Division, has filed a report of waste discharge and has applied for renewal of its waste discharge requirements and National Pollutant Discharge Elimination System permit.

3. United States Pipe and Foundry Company, United Concrete Pipe Division, manufactures concrete and steel pipe at a facility located at 14041 East Live Oak Avenue, Irwindale, California, and discharges up to 1.7 million gallons per day of settling pond overflow consisting mostly of rainwater runoff to San Gabriel River, a water of the United States, at a point about 200 feet upstream from Live Oak Avenue, above the tidal prism.

   The discharge occurs only during and shortly after periods of heavy rainfall when the storage capacity of the pond is exceeded.

   The settling pond receives a mixture of wastewaters from concrete curing, washdown of concrete pouring areas and equipment, single-pass non-contact compressor cooling water, boiler blowdown, water softener regeneration brine, steam condensate, and rainfall runoff. Most of the yard work areas are paved, and those wastewaters and runoff flow to the settling pond for removal of suspended solids and recycling of the ponded water.

4. All the sanitary wastewater from the facility is disposed of onsite by means of a private sewage disposal system consisting of a septic tank and leach field. No community sewer system is available.

5. Waste discharge requirements for disposal of wastes by percolation are prescribed in separate (non-NPDES) Board requirements.

6. The sediment accumulated in the settling pond is periodically removed and disposed of to a legal disposal site.

7. The Board adopted a revised Water Quality Control Plan for Los Angeles River Basin on November 27, 1978. The Plan contains water quality objectives for San Gabriel River. The requirements contained in this Order as they are met will be in conformance with the goals of the Water Quality Control Plan.

8. The beneficial uses of the receiving waters are: water contact and non-water contact recreation; warm and cold freshwater habitat and wildlife habitat; groundwater recharge; and (within the tidal prism) industrial service supply; ocean commercial and sport fishing; preservation of rare and endangered species; marine habitat; and saline water habitat.

9. Effluent limitation standards established pursuant to Section 301 of the Federal Water Pollution Control Act and amendments thereto are applicable to the discharge.

10. The issuance of waste discharge requirements for this discharge is exempt from the provisions of Chapter 3 (commencing with Section 21100) of Division 13 of the Public Resources Code in accordance with Water Code Section 13389.

Re: Tentative Waste Discharge Requirements (NPDES Permit CA0064.920)

Gentlemen:

[illegible]

[illegible]

Problems have occurred at the following:

1. [illegible]

   a. [illegible]
   b. [illegible]
   c. [illegible]
   d. General Monitoring and Reporting Requirements
   e. [illegible]

2. [illegible]

3. [illegible]

4. Statement of Hearing Notice

In accordance with administrative procedures, this Board at a public hearing to be held on September 17, 1984, [illegible] Los Angeles, California, will consider the [illegible] and comments submitted in writing prior to all persons present. The Board will hear and consider any comments pertaining to the [illegible] any person, or persons authorized by [illegible] Any interested person may [illegible]

Any additional comments that any person may wish with respect to this Tentative Order must be received by August [illegible], in order to be included in the Board's agenda folders. However, comments received after that date will still be considered by the Board.

With respect to the [illegible] in accordance with the Federal Water Pollution Control Act [illegible] Tentative Order, pursuant to [illegible] of the Regional Board, [illegible] of the [illegible].

Further, any person who submits written comments on the adoption of waste discharge requirements or discharges waste at or near the subject site may be civilly liable in the amount of up to $10,000 for each day in which such discharge occurs. Failure to submit a report of waste discharge will force us to recommend to this Board for a later hearing and will require the publication of a second notice. Please notify this Board by telephone within the next two days whether or not you intend to submit a report of waste discharge. A penalty of up to $10,000 for each day in which such discharge occurs may be imposed by the Regional Board pursuant to Water Code Section [illegible].

If you have any questions, please call [illegible].

Very truly yours,

[illegible]

WASTE DISCHARGE REQUIREMENTS (NPDES PERMIT NO. CA0001597)

Reference is made to our letter dated July 9, 1984, which transmitted a draft of tentative requirements for your disposal of wastewater to San Gabriel River.

Pursuant to Division 7 of the California Water Code, this California Regional Water Quality Control Board, at a public hearing held on September 17, 1984, reviewed these tentative requirements, considered all factors in the case, and adopted Order No. 84-70 (copy attached) relative to this waste discharge. This Order serves as a permit under the National Pollutant Discharge Elimination System, and expires September 10, 1989. Please note that you must file an application for a new permit at least 180 days in advance of that date.

You are required to implement the new monitoring program as stated in the Monitoring and Reporting Program on the effective date of this Order. Please note that any monitoring report due under your previous Monitoring and Reporting Program is still required and must be submitted by the due date. Please reference all technical and monitoring reports to our Compliance File No. 1056. We would appreciate it if you would not combine other reports, such as progress or technical reports, with your monitoring reports but would submit each type of report as a separate document.

The Board has notified the discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for this discharge and has provided them with an opportunity to submit their written views and recommendations.

The Board in a public hearing heard and considered all comments pertaining to the discharge and to the tentative requirements.

This Order shall serve as a National Pollutant Discharge Elimination System permit pursuant to Section 402 of the Federal Water Pollution Control Act, or amendments thereto, and shall take effect at the end of ten days from the date of its adoption, provided the Regional Administrator, EPA, has no objections.

IT IS HEREBY ORDERED, that United States Pipe and Foundry Company, United Concrete Pipe Division,

in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted thereunder, and the provisions of the Federal Water Pollution Control Act and regulations and guidelines adopted thereunder, shall comply with the following:

A. Effluent Limitations

1. Wastes discharged shall be limited to settling pond overflow during and/or immediately after rainfall only as proposed.

2. The discharge of an effluent in excess of the following limits is prohibited:

		Discharge Limitations
Constituent	Units	Maximum
Oil and grease	mg/l	15
	lbs/day*	213

3. The daily discharge rate shall be obtained from the following calculation for any calendar day:

$$\text{Daily discharge rate} = \frac{8.34}{N} \sum_{i=1}^{N} Q_i C_i$$

in which N is the number of samples analyzed in any calendar day. Q_i and C_i are the flow rate (MGD) and the constituent concentration (mg/l) respectively, which are associated with each of the N grab samples which may be taken in any calendar day. If a composite sample is taken, C_i is the concentration measured in the composite sample and Q_i is the average flow rate occurring during the period over which samples are composited.

* Based on a maximum flow of 1.7 million gallons per day.

4. The pH of wastes discharged shall at all times be within the range 6.0 to 9.0.

5. The temperature of wastes discharged shall not exceed 100°F.

6. Wastes discharged shall not contain visible oil or grease, and shall not cause the appearance of grease, oil or oily slick, or persistent foam in the receiving waters or on channel banks, walls, inverts or other structures.

7. Wastes discharged shall not cause the formation of sludge deposits.

8. Neither the disposal nor any handling of waste shall cause pollution or nuisance.

9. Wastes discharged shall not damage flood control structures or facilities.

10. This discharge shall not cause a violation of any applicable water quality standard for receiving waters adopted by the Regional Board or the State Water Resources Control Board as required by the Federal Water Pollution Control Act and regulations adopted thereunder. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Federal Water Pollution Control Act, or amendments thereto, the Board will revise and modify this Order in accordance with such more stringent standards.

11. Wastes discharged shall not contain any substances in concentrations toxic to human, animal, plant, or aquatic life.

12. Oil or oily material, chemicals, refuse, sweepings, or other pollutionable materials shall not be stored or deposited in areas where they may be picked up by rainfall and carried off of this property or discharged to surface waters.

13. Wastes discharged shall not increase the natural turbidity of the receiving waters.

B. Provisions

1. This Order includes the following items of the attached "Standard Provisions": 1,2,4,5,6,7,8,9, and 11.

2. This Order includes the following items of the attached "Reporting Requirements": 1 and 5.

3. This Order includes the attached "General Monitoring and Reporting Provisions."

4. This Order expires on September 15, 1983, and the discharger must file a Report of Waste Discharge in accordance with Title 23, California Administrative Code, not later than 180 days in advance of such date as application for issuance of new waste discharge requirements.

5. A copy of these waste discharge specifications shall be maintained at the discharge facility so as to be available at all times to operating personnel.

6. In the event of any change in name, ownership, or control of these waste disposal facilities, the discharger shall notify this Board of such change and shall notify the succeeding owner or operator of the existence of this Order by letter, copy of which shall be forwarded to the Board.

7. Any discharge of wastes at any point(s) other than specifically described in this permit is prohibited, and constitutes a violation of the permit.

8. This order may be modified, or, alternatively, revoked and reissued, to comply with any applicable effluent limitation issued pursuant to the order the United States District Court for the District of Columbia issued on June 8, 1976, in Natural Resources Defense Council, Inc. et al. v. Russell E. Train, 8 ERC 2120 (D.D.C. 1976), if the effluent limitation so issued:

   (1) is different in conditions or more stringent than any effluent limitation in this order; or

   (2) controls any pollutant not limited in this order.

9. These requirements do not exempt the operator of this waste disposal facility from compliance with any other laws, regulations, or ordinances which may be applicable; they do not legalize this waste disposal facility, and they leave unaffected any further restraint on the disposal of wastes at this site which may be contained in other statutes or required by other agencies.

10. Order No. 79-150, adopted by this Board on September 24, 1979, is hereby rescinded.

I, Robert P. Ghirelli, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Los Angeles Region, on September 17, 1984.

Robert P. Ghirelli

ROBERT P. GHIRELLI, Executive Officer

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

STANDARD PROVISIONS

- 066597

1. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, nor protect the discharger from his liabilities under federal, state, or local laws, nor guarantee the discharger a capacity right in the receiving waters.

2. The discharge of any radiological, chemical, or biological warfare agent or high level radiological waste is prohibited.

3. The discharger shall require any industrial user of the treatment works to comply with applicable service charges and toxic and pretreatment standards promulgated in accordance with Sections 204(b), 307, and 308 of the Federal Water Pollution Control Act or amendments thereto. The discharger shall require each individual user to submit periodic notice (over intervals not to exceed nine months) of progress toward compliance with applicable toxic and pretreatment standards developed pursuant to the Federal Water Pollution Control Act or amendments thereto. The discharger shall forward a copy of such notice to the Board and the Regional Administrator.

4. The discharger shall permit the Regional Board:

   (a) Entry upon premises in which an effluent source is located or in which any required records are kept;

   (b) Access to copy any records required to be kept under terms and conditions of this Order;

   (c) Inspection of monitoring equipment or records, and

   (d) Sampling of any discharge.

5. All discharges authorized by this Order shall be consistent with the terms and conditions of this Order. The discharge of any pollutant more frequently than or at a level in excess of that identified and authorized by this Order shall constitute a violation of the terms and conditions of this Order.

6. The discharger shall maintain in good working order and operate as efficiently as possible any facility or control system installed by the discharger to achieve compliance with the waste discharge requirements.

7. Collected screening, sludges, and other solids removed from liquid wastes shall be disposed of at a legal point of disposal, and in accordance with the provisions of Division 7.5 of the California Water Code. For the purpose of this requirement, a legal point of disposal is defined as one for which waste discharge requirements have been prescribed by a regional water quality control board and which is in full compliance therewith.

8. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:

   (a) Violation of any term or condition contained in this Order;

   (b) Obtaining this Order by misrepresentation, or failure to disclose all relevant facts;

   (c) A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

9. If a toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standards or prohibition) is established under Section 307(a) of the Federal Water Pollution Control Act, or amendments thereto, for a toxic pollutant which is present in the discharge authorized herein and such standard or prohibition is more stringent than any limitation upon such pollutant in this Order, the Board will revise or modify this Order in accordance with such toxic effluent standard or prohibition and so notify the discharger.

10. There shall be no discharge of harmful quantities of oil or hazardous substances, as specified by regulation adopted pursuant to Section 311 of the Federal Water Pollution Control Act, or amendments thereto.

11. In the event the discharger is unable to comply with any of the conditions of this Order due to:

   (a) breakdown of waste treatment equipment;

   (b) accidents caused by human error or negligence; or

   (c) other causes such as acts of nature,

   the discharger shall notify the Executive Officer by telephone as soon as he or his agents have knowledge of the incident and confirm this notification in writing within two weeks of the telephone notification. The written notification shall include pertinent information explaining reasons for the non-compliance and shall indicate what steps were taken to correct the problem and the dates thereof, and what steps are being taken to prevent the problem from recurring.

12. Supervisors and operators of publicly owned wastewater treatment plants shall possess a certificate of appropriate grade in accordance with regulations adopted by the State Water Resources Control Board.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

REPORTING REQUIREMENTS No. 0001597

1. The discharger shall file with the Board technical reports on self-monitoring work performed according to the detailed specifications contained in any Monitoring and Reporting Programs as directed by the Executive Officer.

2. The discharger shall file a written report with the Board within 90 days after the average dry-weather waste flow for any month equals or exceeds 75 percent of the design capacity of his waste treatment and/or disposal facilities. The discharger's senior administrative officer shall sign a letter which transmits that report and certifies that the policy-making body is adequately informed about it. The report shall include:

   Average daily flow for the month, the date on which the instantantaneous peak flow occurred, the rate of that peak flow, and the total flow for that day.

   The discharger's best estimate of when the average daily dry-weather flow rate will equal or exceed the design capacity of his facilities.

   The discharger's intended schedule for studies, design, and other steps needed to provide additional capacity for his waste treatment and/or disposal facilities before the waste flow rate equals the capacity of present units. (Reference: Sections 13260, 13267(b), and 13268, California Water Code).

3. The discharger shall notify the Board not later than 120 days in advance of implementation of any plans to alter production capacity of the product line of the manufacturing, producing or processing facility by more than ten percent. Such notification shall include estimates of proposed production rate, the type of process, and projected effects on effluent quality. Notification shall include submittal of a new report of waste discharge and appropriate filing fee.

4. The discharger shall notify the Board of (a) new introduction into such works of pollutants from a source which would be a new source as defined in Section 306 of the Federal Water Pollution Control Act, or amendments thereto, if such source were discharging pollutants to the waters of the United States, (b) new introductions of pollutantsinto such works from a source which would be subject to Section 301 of the Federal Water Pollution Control Act, or amendments thereto, if substantial change in the volume or character of pollutants being introduced into such works by a source introducing pollutants into such works at the time the waste discharge requirements were adopted. Notice shall include a description of the quantity and quality of pollutants and the impact of such change on the substantial change in volume is considered an increase of ten percent in the mean dry-weather flow rate. The discharger shall forward a copy of such notice directly to the Regional Administrator.

5. The discharger shall file with the Board a report on waste discharge at least 120 days before making any material change or proposed change in the character, location or volume of the discharge.

6. This Board requires the discharger to file with the Board, within 90 days after the effective date of this Order, a technical report on his preventive (failsafe) and contingency (cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events. The technical report should:

   Identify the possible sources of accidental loss, untreated waste bypass, and contaminated drainage. Loading and storage areas, power outage, waste treatment unit outage, and failure of process equipment, tanks and pipes should be considered.

   Evalulate the effectiveness of present facilities and procedures and state when they became operational.

   Describe facilities and procedures needed for effective preventive and contingency plans.

   Predict the effectiveness of the proposed facilities and procedures and provide an implementation schedule containing interim and final dates when they will be constructed, implemented, or operational. (Reference: Sections 13267(b) and 13268, California Water Code.

   This Board, after review of the technical report, may establish conditions which it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions may be incorporated as part of this Order, upon notice to the discharger.

7. The discharger shall submit to the Board, by January 30 of each year, an annual summary of the quantities of all chemicals, listed by both trade and chemical names, which are used for cooling and/or boiler water treatment and which are discharged.

8. The discharger shall submit to the Board, together with the first monitoring report required by this permit, a list of all chemicals and proprietary additives which could affect this waste discharge, including quantities of each. Any subsequent changes in types and/or quantities shall be reported promptly.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

000159

GENERAL MONITORING AND REPORTING PROVISIONS

GENERAL PROVISIONS FOR SAMPLING AND ANALYSIS

All sampling, sample preservation, and analyses shall be performed in accordance with the latest edition of "Guidelines Establishing Test Procedures for Analysis of Pollutants", promulgated by the United States Environmental Protection Agency.

All chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by the State Department of Health Services.

Effluent samples shall be taken downstream of any addition to the treatment works and prior to mixing with the receiving waters.

The discharger shall calibrate and perform maintenance procedures on all monitoring instruments and equipment to insure accuracy of measurements, or shall insure that both activities will be conducted.

A grab sample is defined as an individual sample collected in fewer than 15 minutes.

A composite sample is defined as a combination of no fewer than eight individual samples obtained over the specified sampling period. The volume of each individual sample is proportional to the discharge flow rate at the time of sampling. The sampling period shall equal the discharge period, or 24 hours, whichever period is shorter.

GENERAL PROVISIONS FOR REPORTING

For every item where the requirements are not met, the discharger shall submit a statement of the actions undertaken or proposed which will bring the discharge into full compliance with requirements at the earliest time and submit a timetable for correction.

The discharger shall maintain all sampling and analytical results, including strip charts; date, exact place, and time of sampling; date analyses were performed; analyst's name, analytical techniques used; and results of all analyses. Such records shall be retained for a minimum of three years. This period of retention shall be extended during the course of any unresolved litigation regarding this discharge or when requested by the Board.

(Revised 7/23/84)
(Revised 8/17/84)

In reporting the monitoring data, the discharger shall arrange the data in tabular form so that the date, the constituents, and the concentrations are readily discernible. The data shall be summarized to demonstrate compliance with waste discharge requirements and, where applicable, shall include results of receiving water observations.

000159

Monitoring reports shall be signed by:

a. In the case of corporations, by a principal executive officer at least of the level of vice-president or his duly authorized representative, if such representative, is responsible for the overall operation of the facility from which discharge originates;

b. In the case of a partnership, by a general partner;

c. In the case of a sole proprietorship, by the proprietor;

d. In the case of municipal, state or other public facility, by either a principal executive officer, ranking elected official, or other duly authorized employee.

Each report shall contain the following completed declaration:

"I declare under penalty of perjury that the foregoing is true and correct.

Executed on the _____ day of _____
at _____.

_____(Signature)

_____(Title)"

The discharger shall mail a copy of each monitoring report to the following:

EXECUTIVE OFFICER
CALIFORNIA REGIONAL WATER QUALITY
CONTROL BOARD - LOS ANGELES REGION
107 South Broadway - Room 4027
Los Angeles, CA 90012-4596

Effluent Monitoring

A sampling station shall be established for each point of discharge and shall be located where representative samples of that effluent can be obtained. The following shall constitute the effluent monitoring program:

Constituent	Units	Type of Sample	Minimum Frequency of Analysis*
pH	pH units	grab	once per discharge event
Temperature	°F	grab	once per discharge event
Total waste flow	gal/day	----	once per discharge day
Oil and grease	mg/l	grab	once per discharge event
Turbidity	NTU	grab	once per discharge event

* Samples shall be taken during the first hour of discharge. No more than one sample per month is required during periods of extended rainfall.

Ordered by Robert P. Ghirelli
Executive Officer

SEP 17 1984

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

STANDARD PROVISIONS

00001597

1. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, nor protect the discharger from his liabilities under federal, state, or local laws, nor guarantee the discharger a capacity right in the receiving waters.

2. The discharge of any radiological, chemical, or biological warfare agent or high level radiological waste is prohibited.

3. The discharger shall require any industrial user of the treatment works to comply with applicable service charges and toxic and pretreatment standards promulgated in accordance with Sections 204(b), 307, and 308 of the Federal Water Pollution Control Act or amendments thereto. The discharger shall require each individual user to submit periodic notice (over intervals not to exceed nine months) of progress toward compliance with applicable toxic and pretreatment standards developed pursuant to the Federal Water Pollution Control Act or amendments thereto. The discharger shall forward a copy of such notice to the Board and the Regional Administrator.

4. The discharger shall permit the Regional Board:

   (a) Entry upon premises in which an effluent source is located or in which any required records are kept;

   (b) Access to copy any records required to be kept under terms and conditions of this Order;

   (c) Inspection of monitoring equipment or records, and

   (d) Sampling of any discharge.

5. All discharges authorized by this Order shall be consistent with the terms and conditions of this Order. The discharge of any pollutant more frequently than or at a level in excess of that identified and authorized by this Order shall constitute a violation of the terms and conditions of this Order.

6. The discharger shall maintain in good working order and operate as efficiently as possible any facility or control system installed by the discharger to achieve compliance with the waste discharge requirements.

7. Collected screening, sludges, and other solids removed from liquid wastes shall be disposed of at a legal point of disposal, and in accordance with the provisions of Division 7.5 of the California Water Code. For the purpose of this requirement, a legal point of disposal is defined as one for which waste discharge requirements have been prescribed by a regional water quality control board and which is in full compliance therewith.

8. After notice and opportunity for a hearing, this Order may be terminated or modified for cause, including, but not limited to:

   (a) Violation of any term or condition contained in this Order;

   (b) Obtaining this Order by misrepresentation, or failure to disclose all relevant facts;

   (c) A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.

9. If a toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standards or prohibition) is established under Section 307(a) of the Federal Water Pollution Control Act, or amendments thereto, for a toxic pollutant which is present in the discharge authorized herein and such standard or prohibition is more stringent than any limitation upon such pollutant in this Order, the Board will revise or modify this Order in accordance with such toxic effluent standard or prohibition and so notify the discharger.

10. There shall be no discharge of harmful quantities of oil or hazardous substances, as specified by regulation adopted pursuant to Section 311 of the Federal Water Pollution Control Act, or amendments thereto.

11. In the event the discharger is unable to comply with any of the conditions of this Order due to:

   (a) breakdown of waste treatment equipment;

   (b) accidents caused by human error or negligence; or

   (c) other causes such as acts of nature,

   the discharger shall notify the Executive Officer by telephone as soon as he or his agents have knowledge of the incident and confirm this notification in writing within two weeks of the telephone notification. The written notification shall include pertinent information explaining reasons for the non-compliance and shall indicate what steps were taken to correct the problem and the dates thereof, and what steps are being taken to prevent the problem from recurring.

12. Supervisors and operators of publicly owned wastewater treatment plants shall possess a certificate of appropriate grade in accordance with regulations adopted by the State Water Resources Control Board.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD

LOS ANGELES REGION

CA0001597

REPORTING REQUIREMENTS

1. The discharger shall file with the Board technical reports on self-monitoring work performed according to the detailed specifications contained in any Monitoring and Reporting Programs as directed by the Executive Officer.

2. The discharger shall file a written report with the Board within 90 days after the average dry-weather waste flow for any month equals or exceeds 75 percent of the design capacity of his waste treatment and/or disposal facilities. The discharger's senior administrative officer shall sign a letter which transmits that report and certifies that the policy-making body is adequately informed about it. The report shall include:

   Average daily flow for the month, the date on which the instantantaneous peak flow occurred, the rate of that peak flow, and the total flow for that day.

   The discharger's best estimate of when the average daily dry-weather flow rate will equal or exceed the design capacity of his facilities.

   The discharger's intended schedule for studies, design, and other steps needed to provide additional capacity for his waste treatment and/or disposal facilities before the waste flow rate equals the capacity of present units. (Reference: Sections 13260, 13267(b), and 13268, California Water Code).

3. The discharger shall notify the Board not later than 120 days in advance of implementation of any plans to alter production capacity of the product line of the manufacturing, producing or processing facility by more than ten percent. Such notification shall include estimates of proposed production rate, the type of process, and projected effects on effluent quality. Notification shall include submittal of a new report of waste discharge and appropriate filing fee.

4. The discharger shall notify the Board of (a) new introduction into such works of pollutants from a source which would be a new source as defined in Section 306 of the Federal Water Pollution Control Act, or amendments thereto, if such source were discharging pollutants to the waters of the United States, (b) new introductions of pollutantsinto such works from a source which would be subject to Section 301 of the Federal Water Pollution Control Act, or amendments thereto, if substantial change in the volume or character of pollutants being introduced into such works by a source introducing pollutants into such works at the time the waste discharge requirements were adopted. Notice shall include a description of the quantity and quality of pollutants and the impact of such change on the substantial change in volume is considered an increase of ten percent in the mean dry-weather flow rate. The discharger shall forward a copy of such notice directly to the Regional Administrator.

5. The discharger shall file with the Board a report on waste discharge at least 120 days before making any material change or proposed change in the character, location or volume of the discharge.

6. This Board requires the discharger to file with the Board, within 90 days after the effective date of this Order, a technical report on his preventive (failsafe) and contingency (cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events. The technical report should:

   Identify the possible sources of accidental loss, untreated waste bypass, and contaminated drainage. Loading and storage areas, power outage, waste treatment unit outage, and failure of process equipment, tanks and pipes should be considered.

   Evalulate the effectiveness of present facilities and procedures and state when they became operational.

   Describe facilities and procedures needed for effective preventive and contingency plans.

   Predict the effectiveness of the proposed facilities and procedures and provide an implementation schedule containing interim and final dates when they will be constructed, implemented, or operational. (Reference: Sections 13267(b) and 13268, California Water Code.

   This Board, after review of the technical report, may establish conditions which it deems necessary to control accidental discharges and to minimize the effects of such events. Such conditions may be incorporated as part of this Order, upon notice to the discharger.

7. The discharger shall submit to the Board, by January 30 of each year, an annual summary of the quantities of all chemicals, listed by both trade and chemical names, which are used for cooling and/or boiler water treatment and which are discharged.

8. The discharger shall submit to the Board, together with the first monitoring report required by this permit, a list of all chemicals and proprietary additives which could affect this waste discharge, including quantities of each. Any subsequent changes in types and/or quantities shall be reported promptly.

GENERAL MONITORING AND REPORTING PROVISIONS

CA0001597

GENERAL PROVISIONS FOR SAMPLING AND ANALYSIS

All sampling, sample preservation, and analyses shall be performed in accordance with the latest edition of "Guidelines Establishing Test Procedures for Analysis of Pollutants", promulgated by the United States Environmental Protection Agency.

All chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by the State Department of Health.

Effluent samples shall be taken downstream of any addition to the treatment works and prior to mixing with the receiving waters.

The discharger shall calibrate and perform maintenance procedures on all monitoring instruments and equipment to insure accuracy of measurements, or shall insure that both activities will be conducted.

A grab sample is defined as an individual sample collected in fewer than 15 minutes.

A composite sample is defined as a combination of no fewer than eight individual samples obtained over the specified sampling period. The volume of each individual sample is proportional to the discharge flow rate at the time of sampling. The sampling period shall equal the discharge period, or 24 hours, whichever period is shorter.

GENERAL PROVISIONS FOR REPORTING

For every item where the requirements are not met, the discharger shall submit a statement of the actions undertaken or proposed which will bring the discharge into full compliance with requirements at the earliest time and submit a timetable for correction.

By January 30 of each year, the discharger shall submit an annual report to the Board. The report shall contain both tabular and graphical summaries of the monitoring data obtained during the previous year. In addition, the discharger shall discuss the compliance record and the corrective actions taken or planned which may be needed to bring the discharge into full compliance with the waste discharge requirements.

The discharger shall maintain all sampling and analytical results, including strip charts; date, exact place, and time of sampling; date analyses were performed; analyst's name; analytical techniques used; and results of all analyses. Such records shall be retained for a minimum of three years. This period of retention shall be extended during the course of any unresolved litigation regarding this discharge or when requested by the Board.

(Revised 9/19/77)

In reporting the monitoring data, the discharger shall arrange the data in tabular form so that the dates, the constituents, and the concentrations are readily discernible. The data shall be summarized to demonstrate compliance with waste discharge requirements and, where applicable, shall include results of receiving water observations.

Monitoring reports shall be signed by:

a. In the case of corporations, by a principal executive officer at least of the level of vice-president or his duly authorized representative, if such representative is responsible for the overall operation of the facility from which discharge originates;

b. In the case of a partnership, by a general partner;

c. In the case of a sole proprietorship, by the proprietor;

d. In the case of municipal, state or other public facility, by either a principal executive officer, ranking elected official, or other duly authorized employee.

Each report shall contain the following completed declaration:

"I declare under penalty of perjury that the foregoing is true and correct.

Executed on the _____ day of _____, _____

HMUSP APPLICATION FORM

1. This application shall be used for new or existing facility permits only.

2. Do not use this form for closure.

3. If information on the mailing label is not correct please make the correction in the space provided on the permit application form and **not on the label.**

4. 24 hours emergency person must be the person responsible for maintaining the facility.

6. The statement verifing present safe storage **for each tank** must contain result of a recent tank integrity test, or description of an inventory control program, and a certified statement by the owner as to why he believes that no unauthorized discharge or release have occured at the facility said above to the best of his knowledge.

7. See the attached schedule for fee determination.

8. Person signing the HMUSP application must be either the owner, responsible Corporate officer of the facility, or a partner.

Official Registration Form

California Water Resources Control Board

Hazardous Substance Storage Statement

Who Must File: Each person storing hazardous substances in any underground container must file this form no later than July 1, 1984 (After October 1, 1984 and no later than January 1, 1985 for tanks used on farms)

Definition of Underground Containers: The law applies to concrete sumps, nonvaulted buried tanks or other underground containers. (Water Code section 13273) All containers, including earthen walled pits, ponds, lagoons and sumps, that are below the normal ground surface level must register. A tank sitting on the ground is not included. Containers partially beneath the surface are included. Lined or unlined pits, ponds and lagoons are covered if earth has been removed from the storage area to construct the facility. Normal grading is not considered construction below ground level.

Definition of Hazardous Substance: Any substance listed in Section 6382 of the Labor Code or in Section 25316 of the Health and Safety Code. This includes gasoline, diesel fuel, all industrial solvents, pesticides, herbicides and fumigants. If the material must be carried by a registered hauler, disposed of at a hazardous waste site, is explosive, generates pressure due to heat or decomposition or would harm humans or wildlife you must register the tank. Wastes are included.

Fee: For each tank registered a $10 fee must be paid, except that retail gasoline stations pay $5 per tank.

Penalties: For failure to file, the penalty is $500-$5,000 per day. If you falsify information, you can be fined up to $20,000 for each day the information is incorrect and has not been corrected.

Confidentiality: If you have information protected by trade secret laws, please attach a list of the information on this form that is confidential and the justification for confidentiality, including specific citations of relevant statutory and case law.

Multiple Containers: Fill I and II on one form and leave it blank on all remaining forms. Attach all forms together securely. If you own more than 50 tanks you can file information on computer tape. Call 916/324-1262 for information.

This is not a Permit Application. All Underground Tanks will be subject to local regulation. Some jurisdictions have already begun programs. Check with your local county government for further information.

NOTE: ALL UNDERGROUND CONTAINERS MUST REGISTER EVEN IF STATE AND/OR LOCAL PERMITS ARE IN FORCE.

California Water Resources Control Board

Hazardous Substance Storage Statement

Who Must File: Each person storing hazardous substances in any underground container must file this form no later than July 1, 1984 (After October 1, 1984 and no later than January 1, 1985 for tanks used on farms)

Definition of Underground Containers: The law applies to concrete sumps, nonvaulted buried tanks or other underground containers. (Water Code section 13173) All containers, including earthen walled pits, ponds, lagoons and sumps that are below the normal ground surface level must register. A tank setting on the ground is not included. Containers partially beneath the surface are included. Lined or unlined pits, ponds and lagoons are covered if earth has been removed from the storage area to construct the facility. Normal grading is not considered construction below ground level.

Definition of Hazardous Substance: Any substance listed in Section 6382 of the Labor Code or in Section 25316 of the Health and Safety Code. This includes gasoline, diesel fuel, all industrial solvents, pesticides, herbicides and fumigants. If the material must be carried by a registered hauler, disposed of at a hazardous waste site, is explosive, generates pressure due to heat or decomposition or would harm humans or wildlife you must register the tank. Wastes are included.

Fee: For each tank registered a $10 fee must be paid except that retail gasoline stations pay $5 per tank.

Penalties: For failure to file the penalty is $500 $5,000 per day. If you falsify information you can be fined up to $20,000 for each day the information is incorrect and has not been corrected.

Confidentiality. If you have information protected by trade secret law, please attach a list of the information on this form that is confidential and the justification for confidentiality, including specific citations of relevant statutory and case law.

Multiple Containers: Fill I and II on one form and leave it blank on all remaining forms. Attach all forms together securely. If you own more than 50 tanks you can file information on computer tape. Call 916/324-1262 for information.

This is not a Permit Application. All Underground Tanks will be subject to local regulation. Some jurisdictions have already begun programs. Contact with your local county government for further information.

NOTE: ALL UNDERGROUND CONTAINERS MUST REGISTER EVEN IF STATE AND/OR LOCAL PERMITS ARE IN FORCE

California Water Resources Control Board

Hazardous Substance Storage Statement

Who Must File: Each person storing hazardous substances in any underground container must file this form no later than July 1, 1984 (After October 1, 1984 and no later than January 1, 1985 for tanks used on farms).

Definition of Underground Containers: The law applies to concrete sumps, abandoned buried tanks or other underground containers. (Water Code section 13173). All containers including earthen walled pits, ponds, lagoons and sumps, that are below the normal ground surface level, must register. A tank sitting on the ground is not included. Containers partially beneath the surface are included. Lined or unlined pits, ponds and lagoons are covered if earth has been removed from the storage area to construct the facility. Normal grading is not considered construction below ground level.

Definition of Hazardous Substance: Any substance listed in Section 6382 of the Labor Code or in Section 25316 of the Health and Safety Code. This includes gasoline, diesel fuel, all industrial solvents, pesticides, herbicides and fumigants. If the material must be called by a registered hauler, disposed of at a hazardous waste site, is explosive, generates pressure due to heat or decomposition or would harm humans or wildlife, you must register the tank. Wastes are included.

Fee: For each tank registered a $10 fee must be paid, except that retail gasoline stations pay $5 per tank.

Penalties: For failure to file, the penalty is $500 - $5,000 per day. If you falsify information, you can be fined up to $20,000 for each day the information is incorrect and has not been corrected.

Confidentiality: If you have information protected by trade secret law, please attach a list of the information on this form that is confidential and the justification for confidentiality, including specific citations of relevant statutory and case law.

Multiple Containers: Fill I and II on one form and leave it blank on all the remaining forms. Attach all forms together securely. If you own more than 50 tanks you can file information on computer tape. Call (916) 324-1965 for information.

This is not a Permit Application. All underground Tanks will be subject to local regulation. Some jurisdictions have already begun programs. Check with your local county government for further information.

NOTE: ALL UNDERGROUND CONTAINERS MUST REGISTER EVEN IF STATE AND/OR LOCAL PERMITS ARE IN FORCE

L. A. COUNTY ENGINEER
SANITATION DIVISION

Mr. Carl Sjoberg
County of Los Angeles
Department of Public Works
Sanitation Division
550 South Vermont
Los Angeles, California 90020

Dear Mr. Sjoberg:

In compliance with the Hazardous Materials Underground Storage Application, we are forwarding herewith the application form and copies of the Hazardous Substance Storage Statements as previously filed with the State, along with our check covering State and County fees.

Tank tests or adequate inventory control records are not available at this time, so that portion of the application is not enclosed. Bids are pending from two companies who perform underground tank tests, and we have been in contact with a third about purchasing their equipment and becoming certified to use it. Doing our own testing looks the most attractive at this time, however, test results will not be available as soon as if the testing was contracted out. If a delay in forwarding the test results would create any problems, please notify us as soon as possible.

Regards,

Frederick C. Gobler, P. E.

Gentlemen:

HAZARDOUS MATERIALS UNDERGROUND STORAGE PERMIT (HMUSP) REQUEST

FACILITY AT: 14041 E. LIVE OAK AVE,

We are unable to process your provisional HMUSP because the requirement(s) checked below have not been met:

[ ] HMUSP application required/incomplete, see enclosed instructions.

[ ] Permit application fee and/or state surcharge per the enclosed invoice is required.

[ ] Tank Assesment Statements (TAS) forms must be completed for each tank.

[X] Provide verification of present safe storage for each tank. Verification is to consist of results of a recent tank integrity test, or description of an inventory control program and/or a certified statement by the owner as to why he believes that no unauthorized discharge or release has occured at this facility.

C 63790

Submittal of Leak Detection/Monitoring programs are not a minimum requirement for issuance of a provisional HMUSP. However, applicants are advised that an acceptable leak detection/monitoring programs must be implemented within six months from the effective date of provisional HMUSP.

If you require additional information concerning the provisional HMUSP, please contact STEPHEN BERGER at (213) 738-2533.

Very truly yours,

T. A. TIDEMANSON

RECEIVED
JUN 17 1985
L. A. COUNTY ENGINEER
SANITATION DIVISION

June 14, 1985

Mr. Stephen Berger
Los Angeles County
Department of Public Works
Sanitation Division
550 S. Vermont Avenue
Los Angeles, CA 90020

Dear Mr. Berger:

Per your conversation with Fritz Gobler, we are proposing the folloiwng measures to provide verification of safe storage for our eight underground storage tanks.

Our inventory control program will provide a running, daily log of inputs and withdrawals from the four fuel tanks currently in use, and the results will be compared with those found by "sticking" the tanks. Determination of a leak will be made using the California Administrative Code, Title 23, Chapter 3, Subchapter 16, dated January 18, 1985, as the guideline.

The three tanks not currently in use have been filled with water and a preservative, and shall be "sticked" weekly with leak determination, using the guidelines set up in the previously mentioned code.

We also have a concrete-walled drain oil sump from which there is currently no means of measuring input or outputs. Because of this, we cannot monitor this sump using the same method as the other seven tanks, and are looking into other options that will prove our safe storage.

To the best of our knowledge, we have had no leaks or other unauthorized discharges from any of the aforementioned underground tanks, and request that we be issued a provisional hazardous materials underground storage permit.

Sincerely,

Dan J. Arnold

CONDITIONS A -- GENERAL

1. Closures shall be carried out such that all applicable regulations from the following agencies are complied with: Los Angeles County, Department of County Engineer-Facilities; Los Angeles County Fire Department, Fire Prevention Division or the appropriate City Fire Department; South Coast Air Quality Management District; and Los Angeles County Department of Health Services.

2. The County Engineer and Fire Departments shall be notified in advance of any closure in accordance with the following:

   a. Removal of tank shall require a three (3) business day advance notification.

   b. Permanent closure of a tank in place or a temporary closure shall require a 30 day written notification.

3. A fee of $38 per tank shall accompany this application.

4. All abandoned wells shall be destroyed in such a way that they will not produce water or act as a channel for interchange of water, when such interchange may result in deterioration of the quality of water in any or all water bearing formations penetrated, or present a hazard to the safety and well-being of people and animals.

5. A well destruction permit issued by the Los Angeles Department of Health Services shall be required for all wells requiring a permit for their initial construction.

6. Well destruction shall be accomplished according to methods described in the latest "Water Well Standards: State of California" by the Department of Water Resources, contained in Bulletin 74-81, December 1981, or any other methods that will provide equivalent or better protection.

7. Plans for the decontamination of a facility shall be submitted to the County Engineer for approval no later than 30 days before the commencement of such operations. Other agencies having jurisdiction shall also be notified. These agencies include the California Regional Water Quality Board, the Los Angeles County Department of Health Services, and the South Coast Air Quality Management District.

8. Decontamination shall require the following, as a minimum:

   a. Cleaning operation shall be done under the supervision of persons who understand the hazardous potential of the original liquid stored and its components.

   b. The personnel shall be sufficiently skilled to safely carry out such operation.

   c. Contaminated materials removed from such facility shall be disposed of at legal point of discharge.

   d. The operation shall be carried out in a manner that will not endanger the health of the public and the environment.

CONDITIONS B -- TEMPORARY

1. All temporary closures shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, "Abandonment or Removal of Underground Tanks," Part A and any other applicable Parts.

2. A temporary closure shall not exceed 90 days.

CONDITIONS C -- PERMANENT, TANK(S) REMOVAL

1. All tank removals shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Part D and any other applicable Parts.

2. Owners/operators shall notify the Building Department having jurisdiction at the place of removal if a grading permit is necessary.

3. Removed tanks shall not be transported away from the site until an inspection to establish site integrity is carried by the County Engineer.

4. If an appointment has been arranged with a County Engineer inspector to inspect the removal of a tank, the inspector will only wait at the site a reasonable amount of time (approximately one hour) after arriving for the removal to commence. Another closure fee may be charged if the inspector has to return to the site.

5. After inspection, tanks shall be transported to a legal disposal point.

6. If the tank had stored materials other than motor fuel, fuel oil, or waste oil, site integrity shall be demonstrated using the soil sampling and analysis procedures described in CONDITIONS D below.

7. The site shall be backfilled and recompacted to a relative compaction of 90%.

CONDITIONS D -- PERMANENT, TANK(S) IN PLACE

1. All permanent closures of tanks in place shall comply with Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Parts B or C, and any other applicable Parts.

2. Owners/operators shall demonstrate part site integrity as follows:

   a. Test borings shall be slant drilled to intercept a point beneath the center of the tank, if possible. If slant drilling is not feasible, the test borings may be drilled vertically and the reason stated in the report in 2.h. below.

   b. For single tanks, a minimum of two test borings will be required, each located on opposite sides of the tank along the major axis of the tank.

   c. For multiple tanks, as a minimum, borings shall be placed at 20 foot intervals around the tank cluster. The actual number and location of borings shall be evaluated on a case-by-case basis. Tanks separated by 20 feet or more shall be considered single tanks for the purposes of test location and placement.

   d. Soil samples shall be taken at depths of 5, 10, 20, 30 and 40 feet below grade level.

   e. A Shelby Tube or a Modified California Sampler shall be utilized for taking all soil samples.

   f. Soil samples shall be capped immediately with teflon or aluminum.

   g. Soil samples shall not be extruded in the field but are to be immediately placed in a refrigerated ice chest and transported to a state certified laboratory for analysis, using suitable methods.

   h. A report containing the results of the above analysis shall be submitted to the County Engineer.

3. If the soil analysis in 2. above indicates the presence of contaminants, the County Engineer shall require a site investigation as described in Chapter V of the County's "Underground Storage of Hazardous Materials -- Guidelines."

4. A report shall be submitted to the County Engineer containing the results of the site investigation.

HAZARDOUS MATERIALS UNDERGROUND STORAGE
LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION
2250 ALCAZAR STREET
LOS ANGELES, CALIFORNIA 90033

Closure Permit No. 2234 B
File No. I-593-35

To satisfy the permanent closure requirements for underground storage tanks previously storing hazardous materials, site integrity must be demonstrated by the analysis of soil samples and, if applicable, groundwater samples as outlined below. These requirements are in addition to the conditions listed on the Application for Closure or contained in an approved Closure Plan.

1. Samples shall be obtained at the sampling points (SP) indicated on the attached plot plan.

2. For each SP, samples shall be obtained at the following depths:

SP	Depth(s)	Compounds	Analysis Method
1A,B	2' TO 4' BELOW TANK INVERT	TOTAL PETROLEUM HYDROCARBONS	EPA 418.1
2A,B	" " " " " "	" " "	
5A,B	" " " " " "	" " " DX BANK LEAD	EPA 8015

3. All soil samples obtained shall be undisturbed and unexposed prior to analysis. The method used to obtain the samples and the date of sampling shall be included in the final report.

4. If groundwater is encountered during sampling, a groundwater monitoring well shall be established at the most downgradient sampling point. The well shall be developed by removing a minimum of four well volumes and a groundwater sample shall be obtained and analyzed.

5. The analysis results for all soil samples shall be expressed in milligrams per kilogram (mg/kg). Analysis results for groundwater samples shall be expressed in parts per billion (ppb).

6. Analysis results shall be reported on laboratory letterhead and shall include the following information: a) The date the analysis was conducted; b) The method of extraction (if applicable); c) The method of analysis.

7. All soil/groundwater samples obtained shall be handled and transported to a laboratory in strict accordance with applicable EPA regulations utilizing chain-of-custody procedures. Chain-of-custody documentation shall be included in the final report.

8. If the soil/groundwater analysis indicates undefined contamination at the facility, additional sampling shall be required to define the vertical and lateral extent present.

9. A final report that contains all of the above required information shall be submitted to the office above within one (1) month from the sampling date or 180 days from the date of this permit, whichever earlier.

A report will be submitted to the Department of Public Works containing:

1. Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.
2. How and when samples were obtained, handled and transported.
3. If borings were established, the boring logs.
4. Chain-of-custody documentation.
5. Where tanks were taken to.
6. Analysis results on State certified laboratory letterhead showing analysis date, methods of extraction and methods of analysis.
7. Depth of groundwater at facility.
8. Any observations of site contamination.
9. Manifests of hazardous waste disposal, if appropriate.
10. Any remedial action recommendations.
11. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.

Gentlemen:

HAZARDOUS MATERIALS UNDERGROUND STORAGE
CLOSURE PERMIT NO. 2236B
FACILITY AT: 14041 E.Live Oak Ave.

This office has reviewed the soil/groundwater assessment report submitted on January 28, 1987 as required as part of the subject closure procedure. Based on the information submitted, the following action is required:

[ ] The closure is final and no further action is required.

[ ] The soils removed during the tank excavation are unrestricted and may be used as backfill material. The closure is final and no further action is required.

[x] The soils are not suitable as fill material and must be manifested and transported to a hazardous waste disposal facility as required by California Health and Safety Code, Division 20, Chapter 6.2, unless evidence is presented indicating that disposal is proper at a less restricted facility. Copies of all completed manifests shall be submitted to this office indicating legal disposal.

[ ] The permanent closure of the tanks(s) in place shall comply with requirements set by the local Fire Department. Verification must be submitted to this office indicating proper closure and completion of all work.

If you have any questions concerning this matter, please contact Ofori K. Amoah at (213) 226- 4014 .

Very truly yours,

T. A. TIDEMANSON
Director of Public Works

Dear Mr. Amoah:

In accordance with State and Local laws, enclosed is a copy of the underground tank closure and site assessment report from Brown and Caldwell Consulting Engineers for the Baldwin Park Plant. The contents of the report for this site seem to be self explanatory. In light of the limited contamination levels, and deep ground water we request authorization to backfill, and complete the closure at this location.

Your prompt attention would be appreciated, and if there is any additional information I can supply to expedite the process, please contact me.

Very truly yours,

Frederick C. Gobler, P.E.

Subject: Soil Sample Analysis for
United Concrete Pipe Company at
14041 Live Oak Drive
Baldwin Park, California

Dear Mr. Gobler:

Attached is a copy of the subject United Concrete Pipe Division site plan (Attachment A) located in Baldwin Park, California. Also attached are the report of analytical results (Attachment B) for five soil samples taken at the site, a copy of the Chain-of-Custody Record for the samples (Attachment C), and a sketch showing where the samples were taken (Attachment D).

Five soil samples were obtained from a three tank excavation on December 17, 1986. Two 10,000 gallon fuel tanks were pulled initially, on December 11,1986, with a verbal authorization from the County of Los Angeles Fire Prevention Division located on 125 South Baldwin Avenue. Soil samples were not obtained that day because equipment was not available to collect soil from the bottom of the excavation pit. The third, 1,000 gallon fuel tank was removed on December 17, 1986 in the presence of Michael Saenz of the County of Los Angeles Fire Prevention Division.

well depth
↓ Feb. 1984
91.4' →

N.J. fault → 180 feet

Soil samples were obtained by using a clam bucket digger on a 15-10 crane to collect soil at an approximate depth of three feet below where each tank was positioned. Each sample was then collected in a 2-inch diameter brass tube using a hand shovel. The brass tubes were capped with a teflon liner and plastic cap, sealed around the edge of the cap with electrical tape, then placed on ice for storage and transport to the laboratory.

Two soil samples were collected for both the 10,000 gallon regular and the 1,000 gallon gasoline fuel tanks. Only one sample was obtained for the 10,000 gallon diesel tank because the east sidewall to that tank contained a full 10,000 gallon fuel tank which would be in danger of sliding into the pit if excavation continued on the southeast side. Each sample was analyzed for petroleum hydrocarbons using EPA Method 8015. Total fuel hydrocarbon concentrations in the five samples ranged from less than 10 to 560 mg/kg.

A review of the available information indicates groundwater is located approximately 200 feet below the United Concrete site (verbal, Los Angeles Public Works, Loleta Amandy and Bulletin No. 104-2, Planned Utilization of Groundwater Basins - San Gabriel Valley, DWR). The soils beneath the site consist of recent and older alluvium deposits to an approximate depth of 2,500 feet (Bulletin No. 104-2, DWR). These deposits consist predominantly of coarse sands, gravels and boulders which were deposited along the San Gabriel River Channel.

I trust this letter meets your requirements at the present time. If you have any questions, please contact me.

Very truly yours,

Subject: Soil Sample Analysis for
United Concrete Pipe Company at
14041 Live Oak Drive
Baldwin Park, California

Dear Mr. Gobler:

Attached is a copy of the subject United Concrete Pipe Division site plan (Attachment A) located in Baldwin Park, California. Also attached are the report of analytical results (Attachment B) for two additional soil samples taken at the site, a copy of the Chain-of-Custody Record for the samples (Attachment C), and a sketch showing where the samples were taken (Attachment D).

Soil samples were obtained using a clam bucket digger on a 15-10 crane to collect soil at an approximate depth of three feet below the depth of previous samples (reference Brown and Caldwell's Report dated January 19, 1987), as requested by the Los Angeles Fire Prevention Division. Each sample was then collected in a 2-inch diameter brass tube using a hand shovel. The brass tubes were capped with a teflon liner and plastic cap, sealed around the edge of the cap with electrical tape, then placed on ice for storage and transport to the laboratory.

Each sample was analyzed for petroleum hydrocarbons using EPA Method 8015. Total fuel hydrocarbon concentrations in the two samples were not detected at the method detection limit of 5 mg/kg.

I trust this letter meets your requirements at the present time. If you have any questions, please contact me.

Very truly yours,

HAZARDOUS MATERIALS UNDERGROUND STORAGE
CLOSURE PERMIT NO. 1292B/2236B
FACILITY AT: 14041 E.Live Oak Avenue

This office has reviewed the soil/groundwater assessment report submitted on March 17,1987 as required as part of the subject closure procedure. Based on the information submitted, the following action is required:

[X] The closure is final and no further action is required.

[ ] The soils removed during the tank excavation are unrestricted and may be used as backfill material. The closure is final and no further action is required.

[ ] The soils are not suitable as fill material and must be manifested and transported to a hazardous waste disposal facility as required by California Health and Safety Code, Division 20, Chapter 6.2, unless evidence is presented indicating that disposal is proper at a less restricted facility. Copies of all completed manifests shall be submitted to this office indicating legal disposal.

[ ] The permanent closure of the tank(s) in place shall comply with requirements set by the local Fire Department. Verification must be submitted to this office indicating proper closure and completion of all work.

If you have any questions concerning this matter, please contact Ofori Amoah at (213) 226-4014.

Very truly yours,

T. A. TIDEMANSON
Director of Public Works

Dear Mr. Amoah:

Per our conversation, enclosed are Precision Tank Test results for Tanks 1-2, and the Tank Assessment Statement and Fee for Tank 9 which was recently installed. Tank 8 is not in use, and will be closed. Also enclosed is the Brown and Caldwell Report for additional soil sampling where Tank 7 was removed, and hazardous wastes manifests for 55 barrels of fuel-contaminated soil which were disposed of at Casmalia Resources.

We again request authorization to backfill and complete closure at this site.

Very truly yours,

Frederick C. Gobler, P.E.

PROVISIONAL
HAZARDOUS MATERIALS UNDERGROUND STORAGE PERMIT
COUNTY OF LOS ANGELES
DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION
2250 ALCAZAR STREET
LOS ANGELES, CALIFORNIA 90033

PERMIT NO. 157
EXPIRATION DATE OCT 12 1987

PERMISSION IS HEREBY GRANTED UNDER LACC TITLE 11, DIVISION 4 TO:

[illegible] <<<<<<<< FILE NUMBER
[illegible] <<<<<<<< PERMITTEE
[illegible]

[illegible] <<<<<<<< FACILITY ADDRESS

TO STORE HAZARDOUS MATERIALS IN UNDERGROUND TANK(S) LOCATED AT THE FACILITY ABOVE.

NUMBER OF PERMITTED TANKS: 6

THIS PROVISIONAL PERMIT IS SUBJECT TO THE FOLLOWING REQUIREMENTS:

PART A — GENERAL CONDITIONS AND LIMITATIONS (ATTACHED).

PART B — AUTHORIZED HAZARDOUS MATERIAL STORAGE TANKS (ATTACHED).

PART C — SPECIFIC CONDITIONS AND LIMITATIONS:

1. THE PERMITTEE SHALL SUBMIT FOR APPROVAL AND IMPLEMENT A LEAK DETECTION PROGRAM (LDP) AND A TANK MONITORING PROGRAM (TMP) PREPARED IN ACCORDANCE WITH "UNDERGROUND STORAGE OF HAZARDOUS MATERIALS - GUIDELINES FOR EXISTING FACILITIES, OCTOBER 1986."

2. THE FOLLOWING TIME SCHEDULE SHALL APPLY TO SUBMITTALS REQUIRED BY THIS PROVISIONAL PERMIT:

   a. PERMIT FEE DUE BY (SEE INVOICE) To Be Billed

   b. TANK INTEGRITY TEST RESULTS DUE BY JUL 10 1987

   c. PROPOSALS FOR LDP AND TMP DUE BY JUL 10 1987

3. PERMIT EFFECTIVE DATE 3/1/85
   NOTE: THE EFFECTIVE DATE IS DETERMINED BY ORIGINAL DATE OF PERMIT APPLICATION.

PART D — SPECIAL CONDITIONS AND LIMITATIONS ATTACHED. YES [X] NO [ ]

This Provisional Permit is valid only for the continued operation of tanks providing suitable storage and expires six (6) months from the date of issue. Permittee has until the expiration date to complete an approved LDP and to install and be in compliance with an approved TMP. Upon full compliance with the approved LDP and TMP and all other conditions and limitations, this Provisional Permit will be replaced by a full term Operational Permit for the remainder of the unexpired five (5) year term from the effective date unless otherwise noted in Part D above.

T. A. TIDEMANSON
DIRECTOR OF PUBLIC WORKS

PP801 10/86

HAZARDOUS MATERIALS UNDERGROUND STORAGE PERMIT

PART A — GENERAL CONDITIONS AND LIMITATIONS

TERM OF PERMIT

1. The combined provisional and full term operational permits shall be valid for a maximum period of five (5) years from the effective date. However, if the Department of Public Works (DPW) finds that the life expectancy of a facility is less than five (5) years, the DPW may adjust the term of the permit to reflect such a condition.

FEES

2. All fees shall be due and payable on the billing date established by the DPW. Fees not paid within 30 calendar days from the billing date shall be considered delinquent. Delinquent fees shall be subject to a 10 percent penalty fee for each 30 day period beyond the billing date that the fee is due. Permits for which the annual permit fee installment is delinquent for 90 days or more are subject to suspension.

REPORTS AND RECORDS

3. At least annually and due by the anniversary of the effective date of this permit, a written report must be submitted to the Department of Public Works, Waste Management Division, P.O. Box 4089 Terminal Annex, Los Angeles, CA 90051 detailing (but not limited to) the following:

   a. Any changes in the type of hazardous materials stored within the facility.

   b. Any changes in the uses of the underground facility.

   c. Changes or modifications to monitoring procedure.

   d. A detailed account of any unauthorized discharges, and the remedial measures employed.

   e. Any modifications to the facility except for routine required maintenance.

   In the event there has been no change of operation nor unauthorized release, a negative declaration to that effect may be submitted.

   The report or negative declaration shall be certified by the permittee or an authorized representative who is responsible for operations at the facility.

   This report is required by local agencies to satisfy Section 25286(c) of the State of California Health and Safety Code. A report form will be made available to owners and operators to comply with this requirement. The report shall be delinquent 30 days after its due date and as such may result in suspension or revocation of the permit.

4. Every permittee shall provide testing, monitoring (if applicable), and inspections in compliance with this permit and shall maintain records adequate to demonstrate compliance therewith.

5. All required records shall be maintained by the permittee and made available for inspection for a period of time not less than three (3) years from the date of the required annual report for the year during which the testing, monitoring or inspection was performed. Said records shall be made available to the DPW, County Health Officer or Forester and Fire Warden during normal working hours and at any time upon reasonable notice.

RENEWALS AND EXTENSIONS

6. If this is a provisional permit, it may be extended to a maximum of one (1) additional year upon written application stating the reasons for such a request and upon approval by the Director of Public Works.

7. Every application for the renewal of a operational permit or extension of a provisional permit shall be made at least 30 days prior to the expiration date of such permit. If a timely application for renewal has been submitted, the permit shall remain in effect until the DPW has made a decision and any administrative appeal has been exhausted.

APPEALS

8. Any person dissatisfied with the decision of the DPW may appeal the decision, in writing, to the Appeals Board, setting forth with particularity the ground or grounds for the appeal. Such appeal shall be submitted within 30 days after notice of the decision has been given.

ADDITIONAL APPROVALS AND REPAIRS

9. Additional approvals shall be required for any of the following actions:

   a. Tank repair.

   b. Modifications.

   c. Change or addition of hazardous materials stored.

   d. Change of approved monitoring system.

10. Procedures for an application for a permit shall also apply to an application for an additional approval. Each application for an additional approval shall be accompanied by the appropriate fee and supporting information.

11. Any substantial modification or repair of a facility other than minor repairs or emergency repairs shall be in accordance with plans to be submitted to the DPW as an additional approval.

12. Permittee shall carry out routine maintenance, ordinary upkeep and minor repairs in a careful and safe manner. No permit will be required for such maintenance, upkeep and repairs.

13. Permittee may make emergency repairs to a facility in advance of seeking an additional approval whenever an immediate repair is required to prevent or contain an unauthorized discharge or to protect the integrity of the containment. However, within five (5) working days after such emergency repairs have been started, permittee shall seek additional approval by submitting drawings or other information adequate to describe the repairs to the DPW.

CLOSURES, DECONTAMINATION AND NEW CONSTRUCTION

14. Replacement of tanks at an existing facility shall be considered a closure of the tanks to be replaced and a new installation of tanks, and all fees shall be assessed accordingly.

15. No tank shall be abandoned. Tanks which are temporarily out of service, and are intended to be returned to use, must continue to be monitored and inspected. Any tank which is not being monitored and inspected must be closed or removed in a manner approved by the DPW.

16. Prior to any permanent or temporary closures being initiated, an Application for Closure form, the appropriate fee and required supporting information shall be filed with the DPW.

17. Plans for the decontamination of a facility shall be submitted to the DPW for approval no later than 30 days before the commencement of such operations. Other agencies having jurisdiction shall also be notified. These agencies include the California Regional Water Quality Control Board, the Los Angeles County Department of Health Services and the South Coast Air Quality Management District.

18. The installation of a new tank shall require submittal to the DPW of an application for new construction, the appropriate new construction plan clearance fee and supporting information as required by the DPW.

TRANSFERS

19. A Hazardous Materials Underground Storage Permit may be transferred to a new owner of the same facility provided:

   a. The new owner accepts full responsibility for all obligations under this permit at the time of the transfer of the facility.

   b. The transfer shall be documented on a form provided by the DPW within 30 days of transfer of ownership.

   c. The appropriate fee is paid.

UNAUTHORIZED DISCHARGES

20. As soon as any person in charge of a facility or responsible for emergency response for a facility has knowledge of any confirmed or unconfirmed unauthorized discharge of a hazardous material, such person shall take all necessary steps to ensure the discovery, containment, and cleanup of such discharge and shall notify the DPW of the occurrence as required.

21. Any owner or operator who has knowledge of a confirmed unauthorized discharge shall immediately notify the DPW.

22. Within the jurisdiction of the Los Angeles County Fire Department, an unauthorized discharge shall also be reported to the Los Angeles County Forester and Fire Warden, Fire Prevention and Conservation Bureau.

23. The permittee shall institute and complete all actions necessary to remedy the effects of any unauthorized discharge, whether sudden or gradual, and supply information on such actions to the DPW.

24. The continued use of, and permit approval for, existing facilities is subject to review and modification or termination by the DPW whenever there has been any unauthorized discharge. In determining whether continued underground storage in such facility is suitable, the DPW shall consider the age of the facility, the methods of containment, the methods of monitoring, the feasibility of the required retrofit, the concentration of the hazardous materials contained, the severity of potential unauthorized discharge and the suitability of other long term preventive measures.

EVALUATIONS AND INSPECTIONS

25. Whenever the approval or satisfaction of the DPW may be required for a design, monitoring, testing or other technical submittal by a permittee, the DPW may require such permittee, at the permittee's sole cost and expense, to retain a suitable qualified independent engineer, chemist or other appropriate professional consultant acceptable to the DPW, for the purpose of evaluating and rendering a professional opinion respecting the adequacy of such submittal.

26. The DPW may conduct inspections for the purpose of ascertaining compliance by the permittee and effecting corrections of any conditions which would constitute any violation of any statute, code, rule or regulation affecting the underground storage of hazardous materials.

27. Whenever necessary for the purpose of investigation or enforcement, or whenever a representative of the DPW, County Health Officer, or Forester and Fire Warden has reasonable cause to believe that there exists in any structure or upon any premises any condition which constitutes a violation, said representative may enter such structure or premises at all reasonable times to inspect the same, or to perform any duty imposed by law.

28. The permittee shall conduct regular inspections of the facility to assure compliance with this permit and shall maintain logs or file reports in accordance with this permit.

29. The DPW may require the periodic employment of special inspectors to conduct an audit or assessment of permittee's facility to make a hazardous material safety evaluation and to determine compliance.

30. Permittee shall, within 30 days of said evaluation, file with the DPW a plan to implement all recommendations, or shall demonstrate to the satisfaction of the DPW why such recommendations shall not be implemented.

31. The DPW may require that any regular or special inspection by the permittee be made in the presence of a representative of the DPW. The DPW may further require advance notice of not less than 72 hours as to the availability of equipment, material and personnel required to conduct such inspections.

SUSPENSIONS AND REVOCATIONS

32. This permit is subject to suspension or revocation if conditions exist which would justify denial of a permit or if permittee fails to correct unsatisfactory conditions.

33. Failure to adhere to all applicable conditions and limitations of this permit shall constitute a willful violation of Title 11, Division 4 of the Los Angeles County Code and may result in civil or criminal penalties, revocation of this permit, or both.

REF: PROVISIONAL PERMIT NO. 157

Per our conversation, tank integrity tests were forwarded to you on March 5, 1987 to comply with Provisional Permit Part C.1.b., due by July 10, 1987. We plan to have the LDP & TMP submitted to you by June, 1987. In addition, some tanks are mis-numbered in Part B that should be corrected as follows. Please refer to the enclosed Plant Plot Plan if required.

TANK NUMBER	CAPACITY	CONTENTS
~~1~~	10,000 GAL ✓ closed	Diesel ✓

INTRODUCTION

As required by Los Angeles County Department of Public Works, Waste Management Division (LACDPW), United Concrete Pipe Company submits this work plan for compliance of the underground storage tank (UGST) monitoring requirements for existing facilities.

The facility is located at 14041 Live Oak Avenue, Baldwin Park, California (figure 1). United Concrete Pipe Company is currently a concrete pipe manufacturing facility and has been active on this property for approximately fifty (50) years. As a part of the manufacturing process, several underground storage tank facilities have been installed on the property. The monitoring program described in this workplan is proposed for the vehicle fueling area (figure 2).

The vehicle fueling area consists of one (1) single walled steel tank containing unleaded fuel and one (1) double walled fiberglass tank storing diesel. According to United Concrete Pipe personnel, no other materials are known to have been stored in these tanks.

Recently, the diesel fuel tank was installed. A continuous monitoring device operating within the annulus of the tank walls

(Leak Alert Model LA-04) has been installed as required by Los Angeles County Department of Public Works (Rudy's Service Station Equipment & Maintenance Co.). Monitoring of the single walled tank is described in this workplan.

MONITORING ALTERNATIVE

Vadose zone monitoring (vapor) has been chosen as the method for meeting the regulatory requirement. The vadose zone monitoring wells shall be placed as close to the tank as possible. Unless otherwise stated by the LACDPW, in writing, demonstration using a tracer substance to determine the actual detection capabilities of the installed system will not be necessary.

The tank monitoring program (TMP) and the leak detection program (LDP) will be completed simultaneously.

GROUNDWATER DEPTH

Los Angeles Flood Control records were examined for the existence of groundwater and wells at the monitoring site. A well located on the United Concrete Pipe Company property (1S/11W-06P) indicated shallowmost groundwater depth at the time of construction to be approximately 170 feet. More recent data was not available to HydroSolutions of California, Inc. (HSCI).

Alluvial deposits characterize the entire site and adjacent properties. This is easily depicted by gravel pits throughout the area and the San Gabriel River which flows adjacent the west side of the property. The Santa Fe Spillway Dam and channel border the northern perimeter of United Concrete Pipe, thus acting as an intermittent recharge area of the shallowmost groundwater system. Seasonal changes in surface water flow may also result in large fluctuations in groundwater table elevation. Commonly, alluvial deposits may consist of fine grained sediment deposited discontinuously in isolated areas of the alluvium. This could result in local perched groundwater conditions.

Due to the unknown depth of groundwater directly beneath the tank system, HSCI proposes to drill one (1) forty foot boring as stated in Section 3.8.2.b.(1). If groundwater is not encountered, the boring will be backfilled with a sand/bentonite mixture to fifteen (15) feet and completed as a vadose zone well.

MONITORING NETWORK

The monitoring network will consist of two (2) fifteen foot deep monitor wells. Due to the tank size being greater than 1,000 gallons, wells will be installed on opposite sides of the major and minor axis of the tanks, figure 2. Four (4) inch diameter PVC pipe (threaded) is proposed, figure 3. The monitoring well casing will be perforated (0.02 inch slot size) from fifteen (15) to

five (5) feet below groundsurface. Plain casing will be from five feet to groundsurface. A #3 Monterey sand will be utilized as a gravel pack to one (1) foot above the zone of perforations. The remainder of the annulus will be grouted.

FIELD PROGRAM

Borings will be drilled with a ten (10) inch diameter continuous-flight hollow stem auger. A four (4) inch diameter monitor wells will be constructed from each boring. Drilling tools will be thoroughly cleaned with a steam cleaner prior to initiating each boring. Soil samples will be collected with a two (2) inch ID split spoon sampler. Sampling depths will be 5, 10, 20, 30, and 40 feet, respectfully. Two (2) samples will be collected from each depth interval in brass tubes, which are wrapped on the ends with aluminum foil, capped with a PVC cap, taped, and labeled. The sampler and brass tubes will be decontaminated prior to each sampling event. This is accomplished by a soap and water wash, water rinse, and hexane bath, followed by a distilled water rinse. All samples are then stored at reduced temperature in an ice chest and delivered to the laboratory at the end of the day. Standard chain-of-custody forms will accompany all soil samples.

All soil samples will be classified by the Unified Classification System. Field and interpretive work will be completed under the

supervision of a California Certified Geologist.

LABORATORY ANALYSIS

Samples from each boring will be composited at the laboratory and analyzed for total petroleum hydrocarbons by the Modified EPA Method 8015 (TPH). One composited sample will be analyzed from each boring (5, 10, 20, 30, and 40 foot depth intervals).

The TPH content on soils is to be determined by purge and trap techniques. The method detection limit is 1.0 mg/kg. All results will be blank corrected.

SENSORS AND CONTROL MONITOR

The Leak Alert System is a highly reliable, state-of-the-art system for continuous monitoring of UGSTs. Designed and developed by Universal Sensors & Devices, this system provides both visual and audible warnings of locating fluids and/or vapors often generated by leaking fluids. The Leak Alert System has been approved for use by the Electrical Testing Laboratory, Department of Building and Safety, City of Los Angeles, California (Aplication No. 249649). Specific questions regarding the specifications of this system may be referred to the manufacturer (Universal Sensors & Devices, Inc. 818-998-7121).

REPORT WRITING

A report summarizing the results of the LDP will be submitted to the LACDPW office upon completion of the monitor well installation. Field procedures, geologic logs, laboratory results, and other applicable observations will be included in this report.

HAZARDOUS MATERIALS UNDERGROUND STORAGE
LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION
2250 ALCAZAR STREET
LOS ANGELES, CALIFORNIA 90033

Closure Permit No. [illegible] B
File No.
I-[illegible]

To satisfy the permanent closure requirements for underground storage tanks previously storing hazardous materials, site integrity must be demonstrated by the analysis of soil samples and, if applicable, groundwater samples as outlined below. These requirements are in addition to the conditions listed on the Application fo Closure or contained in an approved Closure Plan.

1. Samples shall be obtained at the sampling points (SP) indicated on the attached plot plan.

2. For each SP, samples shall be obtained at the following depths:

SP	Depth(s)	Compounds	Analysis Method
[illegible]	[illegible]	TPH	EPA 418.1
[illegible]			
[illegible]			

3. All soil samples obtained shall be undisturbed and unexposed prior to analysis. The method used to obtain the samples and the date of sampling shall be included in the final report.

4. If groundwater is encountered during sampling, a groundwater monitoring well shall be established at the most downgradient sampling point. The well shall be developed by removing a minimum of four well volumes and a groundwater sample shall be obtained and analyzed.

5. The analysis results for all soil samples shall be expressed in milligrams per kilogram (mg/kg). Analysis results for groundwater samples shall be expressed in parts per billion (ppb).

6. Analysis results shall be reported on laboratory letterhead and shall include the following information: a) The date the analysis was conducted; b) The method of extraction (if applicable); c) The method of analysis.

7. All soil/groundwater samples obtained shall be handled and transported to a laboratory in strict accordance with applicable EPA regulations utilizing chain-of-custody procedures. Chain-of-custody documentation shall be included in the final report.

8. If the soil/groundwater analysis indicates undefined contamination at the facility, additional sampling shall be required to define the vertical and lateral extent present.

9. A final report that contains all of the above required information shall be submitted to the office above within one (1) month from the sampling date or 180 days from the date of this permit, whichever earlier.

LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 4089, Los Angeles, CA 90051 containing:

1. File number of facility and closure permit number.
2. Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.
3. Description of methods for obtaining, handling and transporting samples.
4. Time and date samples were obtained.
5. If borings were established, boring logs certified by a CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.
6. Chain-of-custody documentation initiated by person obtaining sample through person at State Department of Health Services certified laboratory.
7. Disposal destination of tanks and evidence of legal disposal.
8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.
9. Documentation as to depth of groundwater at facility.
10. Manifests to document hazardous waste disposal of any removed soil.
11. Any observations of site contamination.
12. Remedial action plan to mitigate contamination.
13. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.

SUBJECT: LDP/TMP Variance
Vehicle Fueling Area
United Concrete Pipe

RRSP: 87045-01-06

Dear Blair:

This letter summarizes our telephone conversation on August 13, 1987. United Concrete Pipe Company submitted a LDP/TMP workplan for the vehicle fueling area to the Los Angeles County Department of Public Works on August 5, 1987 (RRSP 87045-01-01). The workplan described the design and installation of two (2) vadose zone wells adjacent the 10,000 gallon steel tank. With Los Angeles County Department of Public Works approval, installation activities were initiated August 13, 1987.

The geologic profile of the site is characterized by sand and gravels with discontinuous layers of coarse gravels and/or cobbles. A Mobile B-80 drilling rig utilizing 8 inch diameter augers was used to construct the borings. Penetration into this material became very difficult, eventually impossible. After many efforts, VW-2 was constructed at the proposed location. Boring VW-1 penetrated to seven (7) feet, thus abandoning efforts to construct this well.

In our telephone conversation, it was decided that the following variance would be acceptable:

1. Excavate the overburden adjacent the east side of the tank and dispenser island with a backhoe and construct vadose zone well, VW-1.

2. The well will be a total depth of ten (10) feet. Perforated casing will be used for the entire column.

3. A soil sample will be collected from the ten (10) foot depth and analyzed for TPH by EPA Method 8015.

Your rapid attention to this situation is appreciated. If you have further questions or comments please contact me.

Sincerely,

Stephen J. Baker

SUBJECT: LDP VARIANCE
DRAIN OIL SUMP
UNITED CONCRETE PIPE
14041 LIVE OAK

RRSP: 87044-01-06

Dear Blair:

This letter summarizes our telephone conversation on August 13, 1987. United Concrete Pipe Company submitted a LDP workplan for the drain oil sump to the Los Angeles County Department of Public Works on August 5, 1987 (RRSP 87044-01-01). The workplan described the boring program which was designed to identify the site integrity adjacent the 550 gallon sump. The one boring program was approved by Los Angeles County Department of Public Works and field activities began August 13, 1987.

The geologic profile beneath the site is characterized by sand and gravel with discontinous layers of coarse gravels and/or cobbles. A Mobil B-80 drilling rig utilizing 8 inch diameter augers was used to construct this boring. Penetration into this material became impossible at a five foot depth.

In our telephone conversation, it was decided that the following variance would be acceptable:

1. Change the drilling method to rotary with bentonite slurry as the drilling fluid.

2. Collect three (3) soil samples within a twenty (20) foot depth, composite all samples, and analyze the composited sample by EPA Method 418.1.

3. Total depth will be twenty (20) feet below ground surface.

4. Los Angeles County Department of Public Works will interpret the laboratory data by multiplying the detected total petroleum hydrocarbon concentrations by the number of samples.

Thank you for your rapid attention to this matter. If you have further questions of comments, please call.

Sincerely,

Stephen J. Baker
Project Manager

SUBJECT: SOIL SAMPLING
DRAIN OIL SUMP
UNITED CONCRETE PIPE COMPANY

RRSP: 87044-01-07

Dear Lou:

HydroSolutions of California, Inc. (HSCI) is pleased to submit this letter report regarding the soil sampling event which was completed August 20, 1937 and located at the United Concrete Pipe Company property in Baldwin Park, California. Please find a copy of the laboratory data, boring location map, and chain-of-custody forms resulting from this field activity.

The soil sampling activity was completed adjacent the drain oil sump located at the vehicle maintenance area (figure 1). This sump is not currently in use, however has historically provided temporary storage of vehicle oils.

Los Angeles County Department of Public Works (LACDPW) verbal approval (August 5, 1987) of the tank leak detection program consisted of drilling and soil sampling of one boring to a depth of forty (40) feet. Initial drilling efforts with a Mobil 80 drilling rig experienced difficulty in penetrating the gravel and cobble subsurface. This initial effort was abandoned.

The geologic profile beneath the site is characterized by sand and gravel with discontinuous layers of coarse gravels and/or cobbles (see geologic log, B-3). In our telephone conversation from the site, it was decided that the following variance would be acceptable:

1. Change of drilling method;

2. Collect soil samples from three different depth locations, composite all samples, and analyze the composited sample by EPA Method 418.1;

3. Total depth was to be twenty feet below ground surface.

Drilling was reschedule for August 20, 1987. Two optional drilling methods were available to assure successful penetration and

soil sampling of B-3 (modified auger and mud rotary). An auger equipped with a special drilling bit would first be utilized. This drilling method provides more representative soil samples than samples collected by mud rotary methods. If the auger method was abandoned, mud rotary would be utilized.

Soil samples were collected successfully to approximately a twenty (20) foot depth. Three samples (B-3-10, B-3-15, B-3-20) were delivered to the laboratory, composited, and analyzed for total petroleum hydrocarbons by Modified EPA Method 418.1. A concentration of 296 ppm was detected in the composited sample.

Borings were described using the Unified Soil Classification System and have been reviewed according to Section 2648 (t) of the California UGST Regulations (August, 1985).

It is the responsibility of Rudy's Service Station Equipment and Maintenance, Inc. to disclose to the proper authorities any and all information discovered during this investigation that may pertain to the adverse health and safety to public health, property, and/or environment.

If you have questions or comments regarding the enclosed information, please contact our office.

Respectfully submitted,

Stephen J. Baker

SUBJECT: UNDERGROUND STORAGE TANK MONITOR
WELL COMPLETION, UNITED CONCRETE PIPE
BALDWIN PARK, CALIFORNIA

RRSP: 87045-01-07

Dear Lou:

HydroSolutions of California, Inc. (HSCI) is pleased to submit the enclosed lithologic logs of two (2) borings, vadose zone well completion diagrams, laboratory results of composited samples, well location map, and chain-of-custody forms for the well installations located at the United Concrete Pipe Company facility located in Baldwin Park, California. Field drilling activities were initiated August 13 and completed August 20, 1987.

United Concrete Pipe Company submitted a LDF/TMP workplan for the vehicle fueling area to the Los Angeles County Department of Public Works (LACDPW) on August 5, 1987 (RRSP: 87045-01-01). With the approval of LACDPW, installation of the monitor wells was initiated August 13, 1987.

During initial drilling, sampling to a forty (40) and twenty (20) foot depth became impossible with the Mobil B-80 drilling rig. After many efforts, VW-2 was constructed to an eighteen (18) foot depth. Boring, VW-1, only penetrated to seven (7) feet, thus abandoning efforts to construct this well. Subsequently, telephone correspondence with LACDPW (RRSP:87045-01-06) on August 13, 1987 began and a modified workplan was established. Due to the difficulty in drilling in sand and gravels, it was decided that:

1. VW-1 well would be constructed by excavating with a backhoe to a depth of ten feet immediately adjacent the UGST.

2. A soil sample would be collected and analyzed from the ten foot depth. This sample will be analyzed by EPA Method 8015 for total petroleum hydrocarbons.

The annulus of the well borings were filled according to the well completion diagrams at the end of this report. Surface casings were not installed inorder to facilitate easier installation of sensor wiring. It is our understanding that Rudy's Service Station Equipment & Maintenance, Inc. will supply and install each well head, sensor wiring, control box, sensors, and all other

material required to effectively complete the monitoring program. Soil samples from each boring were composited and analyzed for total petroleum hydrocarbons. EPA Method 8015 was utilized. All samples contained no detectable concentrations of TPH.

No groundwater was encountered during drilling.

Borings were described using the Unified Soil Classification System and have been reviewed according to Section 2648 (t) of the California UGST Regulations (August, 1985).

Location of monitoring wells was approved by the LACDPW. Each well was located as close to the UGST as was safety possible with the available information to HSCI. The rational for the number of wells was to install the quanity required by the regulatory agency.

Utilization of vadose zone monitor wells is an acceptable alternative of monitoring however the present level of this technology is limited. Vadose zone wells, as a sole form of monitoring may not identify small volume leaks. This is due to moisture content of soils, changes in barometric pressure, anisotropies of the unsaturated zone, the location and size of the leak, and leak intensity.

HSCI suggests that all vadose zone wells be considered as a component of a complete monitoring program that supplements other daily/monthly monitoring techniques. Relying on one monitoring method may or may not provide full proof identification of a leak. It is in the client's best interest to incorporate one or several of the following methods and/or preparations:

* In-tank monitoring devices;

* Inventory reconciliation;

* Tank gauging;

* Tank tests;

* Routine maintenance checks of sensors, control box, etc.

* Establish a contingency plan in the event of a leak.

If you have questions or comments regarding the enclosed information, please contact our office.

Respectfully submitted,

Stephen J. Baker
Registered Geologist 4354

SITE LOCATION: United Concrete Pipe	PROJECT NO.: 87045-01
DRILLING AGENCY: Datum Exploration	DATE STARTED: 8-13-87
DRILLING EQUIPMENT: Backhoe	DATE FINISHED: 8-20-87
LOGGED BY: Steve Baker	TOTAL DEPTH: 10 FEET
NUMBER OF SAMPLES COLLECTED: 1	WATER DEPTH: None

DEPTH	LOG	DESCRIPTION	BORING: VW-1
5		SAND & GRAVEL (GW), moist, medium brown, medium to coarse grained sand, GRAVEL (1/2-2 1/2"), no gasoline odor	
10		SAND (SP), moist, medium brown, medium to coarse grained, slight gasoline odor	

NOTE:

Geologic log is based on visual observation only. This information should not be used for any engineering purposes.

Several efforts were attempted to drill with hollow stem auger to the desired depth, however due to the high volume of gravel present, each consecutive effort was abandoned. A backhoe was then utilized to excavate fill sand adjacent the UGST, a grab sample of soil was collected from the bottommost sediment, a ten foot well was constructed, and the excavation backfilled.

Sampling and well construction criteria was approved by the Los Angeles County Department of Public Works.

SITE LOCATION: United Concrete Pipe	PROJECT NO.: 87045-01
DRILLING AGENCY: Datum Exploration	DATE STARTED: 8-13-87

ADDITIONAL CLOSURE REQUIREMENTS

The additional information or requirements checked below must be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 4089, Los Angeles, CA 90051, in order to complete the evaluation of Closure Permit No. 3361B .

[ ] Plot plan to scale showing locations of tanks, sampling points, buildings, adjatent streets and north arrow.

[ ] Insufficient number of samples were obtained. Additional samples required in accordance with attached Closure Permit Requirements.

[ ] Describe method of obtaining, handling, and/or transporting samples.

[ ] Indicate time and date samples were obtained.

[ ] Submit logs certified by a CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils for all borings.

[ ] Submit chain-of-custody documentation initiated by person obtaining sample through person at DOHS certified laboratory.

[X] Disposal destination of tanks and evidence of legal disposal.

[ ] Analysis results by a State certified laboratory shall be submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

[ ] Documentation as to depth of groundwater at facility.

[ ] Manifests to document hazardous waste disposal of removed soil.

[ ] Signature on the report is required of CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

[ ] Define the vertical and lateral extent of contamination.

[ ] Propose a remedial action plan to mitigate contamination.

[X] Other Please include either the triple rinse or tank hazardous waste manifest.

1.0 INTRODUCTION

1.1 PURPOSE OF SCOPE OF WORK

This report summarizes underground storage tank removals and soil sampling operations performed at United Concrete Pipe Division (United). The subject site is located at 14041 East Live Oak Avenue, Baldwin Park, Los Angeles County, California

The work accomplished under Los Angeles County Permit No. 3361-B, on October 14, 1987 consisted of the removal of three diesel fuel underground storage tanks, and collection and quantitative analyses of 6 soil samples, used to document subsurface soil conditions.

United engaged the services of Rudy's Service Station Equipment Maint., Inc. (Rudy's) to perform the excavation and removal of the underground storage tanks. Western Environmental Services (WES) was employed under verbal agreement by Rudy's to: 1) collect soil samples from beneath the bottom of each tank and 2) prepare this report on tank removal operations. Included herewith are discussions on field procedures, laboratory testing, and analytical results for soil samples recovered during the excavation and subsequent tank removals.

2.0 FIELD PROCEDURES

On October 14, 1987, under the supervision of Los Angeles County Fire Department, three underground diesel fuel storage tanks were removed and disposed of properly. The tank numbers, capacities and contents as determined by field personnel are summarized in Table 1.

TABLE 1
SUMMARY OF UNDERGROUND STORAGE TANKS DATA
UNITED CONCRETE

TANK NO.	CAPACITY (gals.)	CONTENTS
1	10,000	Diesel
2	8,000	Diesel
3	8,000	Diesel

Following the removal of the tanks, six soil samples (1A, 1B, 2A, 2B, 3A, 3B) were collected at a depth of two feet below tank bottom by a WES geologist. Sample locations are shown on Figure 1 - Site Plan.

The samples were recovered from the excavations using a back hoe and quickly placed by hand into four ounce glas sample jars, sealed with a teflon-lined lid, each sample within labeled and immediately stored on ice in an ice chest until transport to the laboratory. WES chain-of-custody procedures were followed to ensure the integrity of samples submitted for analyses.

3.0 GEOLOGY

The United site overlays alluvial sediments, gravels and cobbles interbedded with coarse grained sands of recent age. The elevation of the tank pit areas is approximately 400 feet above seal level; the surrounding topography slopes gently to the South. A review of California Department of Water Resources (DWR) records indicate the first principle aquifer beneath the site is greater than 100 feet below the surface; semi-perched zones may occur at shallower depths.

4.0 LABORATORY TESTING AND RESULTS

All samples were submitted for analyses to Chemical Research Laboratories, Stanton, California. Samples were tested for total recoverable hydrocarbons according to E.P.A. method 418.1. The sample is extracted using a horn-type sonicator and examined by infrared spectroscopy. Laboratory certificate and chain-of-custody records are included in Appendix A and B respectively.

Based on laboratory results for samples collected, it appears hydrocarbon leakage has occurred at the site. Sample reference numbers, locations and test results (in parts per million) are summarized in Table 2.

TABLE 2
SUMMARY OF SOIL SAMPLING
D&K CONCRETE

SAMPLE NO.	LOCATION	E.P.A. 418.1 (ppm)
1A	Southside of northern diesel tank	100
1B	Northside of northern diesel tank	ND(1)
2A	Southside of southeast diesel tank	15
2B	Northside of southeast diesel tank	140
3A	Southside of southwest diesel tank	ND(1)
3B	Northside of southwest diesel tank	6

5.0 CONCLUSIONS

In accordance with both State and County Guidelines for Underground Storage of Hazardous Materials, WES has completed a field sampling program associated with the removal of underground fuel tanks at the United facility. The results of field study indicates relatively low concentration of petroleum based hydrocarbons have leaked into the soil at the tank pit locations. Due to the deep groundwater table and dense conglomeratic subsurface soil conditions, we recommend United following regulatory approval backfill, compact and resurface the existing excavation.

If we can be of further assistance or provide further information, feel free to call.

Sincerely

Western Environmental Services

David D. Aronne
Project Geologist

Dear Mr. Gobler:

HAZARDOUS MATERIALS UNDERGROUND STORAGE
APPLICATION FOR CLOSURE
FACILITY AT: 14041 Live Oak Ave.

Please find enclosed an Application for Closure forms per your request.

All existing underground tanks must be either closed or permitted. If the tanks are to be closed, complete the copy of the application form and return with the proper fee and required supporting information.

Soil sampling and analysis will be required for all closures. Soil borings will be required if the tank contained a volatile or semi-volatile priority pollutant, or an extremely hazardous material. A plot plan to scale showing location of tank(s), buildings, adjacent streets, north arrow and proposed soil sampling points must accompany the application forms.

If you have any questions concerning this matter, please contact Mr. Blair Burgess at (213) 226-4437.

Very truly yours,

T. A. TIDEMANSON

HAZARDOUS MATERIALS UNDERGROUND STORAGE
CLOSURE PERMIT NO. 3361B
FACILITY LOCATION: 14041 E. LIVE OAK AVENUE

This office has reviewed the soil/groundwater assessment report submitted on NOV. 18, 1987 required as a part of the subject closure procedure. Based on the information submitted, we find that:

[X] The closure is final and no further action is required.

[ ] The soils removed during the tank excavation are unrestricted and may be used as backfill material. The closure is final and no further action is required.

[ ] Excavated soils may be a hazardous waste and are not suitable for fill material or disposal on-site. Contaminated soils must be manifested, transported and disposed of pursuant to Chapter 6.5, California Health and Safety Code, unless evidence is presented indicating that disposal is proper at a less restricted facility. Copies of completed manifests or other appropriate evidence indicating legal disposal shall be submitted to this office before this project can be considered closed.

[ ] The permanent closure of the tank(s) in place shall comply with requirements set by the local Fire Department. Verification must be submitted to this office indicating proper closure and completion of all work.

If you have any questions concerning this matter, please contact Ms. Nicole Long at (213) 226-4010.

Very truly yours,

T. A. TIDEMANSON

SUBJECT: LDP CLOSURE, DRAIN OIL SUMP
UNITED CONCRETE PIPE COMPANY
11041 LIVE OAK AVENUE
BALDWIN PARK, CALIFORNIA

RRSP: 87044-02-09

Dear Blair:

This letter summarizes the most recent underground storage tank (UGST) closure related activities and our telephone conversation on November 11, 1987. Laboratory results from the August 20, 1987 soil sampling event identified 290 ppm total petroleum hydrocarbons (TPH) in a composited soil sample (B-3-10, B-3-15, B-3-20) collected immediately adjacent the tank. Due to the detected chemical level existing within the action limit enforced by your office, it was decided that the lowermost soil sample be analyzed for TPH as a discrete sample.

The concentration of TPH in B-3-20 was reported by the laboratory (see attached) and to HSCI as non-detectable (less than 10 ppm). In our telephone conversation on November 11, 1987, United Concrete Pipe was provided verbal approval to abandon the 550 gallon capacity tank in-place provide the following criteria are satisfied:

* A reference will be added to the deed of the property. This deed will state that an UGST exists on the premises, the UGST was abandoned according to the Los Angeles County Department of Public Works UGST regulations, minor levels of total petroleum hydrocarbons were detected immediately adjacent the UGST, and details of, the information are found in the HSCI soil sampling report (RRSP: 87044-01-07) dated October 1, 1987 and letter (87044-02-09) dated November 10, 1987;

* A closure permit must be obtained;

* and a tank closure certification from the local fire department is obtained.

C 8704224(a)

Your rapid attention throughout this tank closure activity has been appreciated. If you require further information or additional comment, please contact me.

Respectfully submitted,

Stephen J. Baker

THIS TEMPORARY CLOSURE MUST CONFORM TO THE VISUAL MONITORING REQUIREMENTS BELOW:

41546

3.3.4 Visual Monitoring

Visual monitoring is only acceptable where tanks are situated in a vaulted area, or the escape of product and/or intrusion of groundwater into the secondary containment is immediately visible.

Facilities located in isolated remote areas or that are unmanned for periods of time may not use visual inspection solely as a monitoring method.

As a minimum, monitoring shall be performed five (5) days per week except on County recognized holidays, and shall be more frequent if appropriate.

A written monitoring procedure shall be prepared and available at the facility which includes: (1) the visual inspections; (2) the location(s) from which observations will be made; (3) the name(s) and title(s) of the person(s) responsible for performing the observations; and (4) the reporting format.

C0803794 (2)

Dear Mr. Burgess:

The following is a summary of the work that has been done to our underground tanks since your letter dated April 22, 1988. On May 18th Leak Alert Service Company did a start-up and calibration on the Leak Alert equipment that was installed at this plant, and a copy of the start-up report is enclosed. Corrosion resistant metal tags with all appurtenant information have also been affixed to the wellheads in accordance with Department of Public Works regulations. Also, I have enclosed literature for the spill containment boxes and wellheads that were made by CNI Manufacturing. The Vadose wellheads installed here are CNI #209. This equipment has been installed, but the slab will not be poured until we receive the final LDP/TMP approval. The wellhead design and installation will prevent accidental damage, or water entry into the wells and our 24 hour guard should prevent the possibility of vandalism.

Also enclosed are a temporary closure permit form and a check for $141.00 for tank number 8. This concrete walled drain oil sump is located partially under a building, and we are requesting the one year temporary closure to allow us enough time to explore our options thoroughly. A sub-surface investigation of the sump was conducted by Hydroscolutions of California and a complete report of the study was submitted to the Department of Public Works last fall. The test results indicated some contaminated soil immediately below the sump, but the level was less than 10 PPM at 20 feet.

Rec. check 1-30 $141.00 6-28-88 EM.

P.O. Box 429 • Baldwin Park, California 91706 • Telephone (818) 337-1211

The sump has been empty several years, and all piping has been permanently disconnected, so the standard safety and monitoring procedures for a temporary closure are not possible, but because it has a wood plank top, visual inspections can be performed easily. Therefore, we propose as a monitoring alternate, daily or weekly visual inspections recorded in a log book as proof that the sump has not been used.

These are the last tanks to be brought into compliance, so if the enclosed information is deemed complete by the D.P.W, I hereby request that a permanent HMUSP be issued for the Baldwin Park Plant.

Sincerely,

Fritz C. Gobler, P.E.

CLOSURE PERMIT SUPPLEMENT
HAZARDOUS WASTE UNDERGROUND STORAGE
LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION
900 S. FREMONT AVENUE
ALHAMBRA, CA 91803

Closure Permit No. 5418 B
File No. I-592-55

To satisfy [illegible] requirements for underground storage tanks previously containing hazardous materials, site integrity must be demonstrated by the analysis of soil samples and, if applicable, groundwater samples as outlined below. These requirements are in addition to the conditions listed on the Application for Closure or contained in an approved Closure Plan.

1. Samples shall be obtained at the sampling points (SP) indicated on the attached plot plan.

2. For each SP, samples shall be obtained at the following depths:

SP	Depths	Compounds	Analysis Method
A, B	2' & 6' BELOW TANK INLETS	TPH	EPA 8015 & 418.1

3. All soil samples obtained shall be undisturbed and unexposed prior to analysis. The method used to obtain the samples and the date of sampling shall be included in the final report.

4. If groundwater is encountered during sampling, a groundwater monitoring well shall be established at the most downgradient sampling point. The well shall be developed by removing a minimum of four well volumes and a groundwater sample shall be obtained and analyzed.

5. The analysis results for all soil samples shall be expressed in milligrams per kilogram (mg/kg). Analysis results for groundwater samples shall be expressed in parts per billion (ppb).

6. Analysis results shall be reported on laboratory letterhead and shall include the following information: a) The date the analysis was conducted; b) The method of extraction (if applicable); c) The method of analysis.

7. All soil/groundwater samples obtained shall be handled and transported to laboratory in strict accordance with applicable EPA regulations utilizing chain-of-custody procedures. Chain-of-custody documentation shall be included in the final report.

8. If the soil/groundwater analysis indicates undefined contamination at the facility, additional sampling shall be required to define the vertical and lateral extent present.

9. A final report that contains all of the above required information shall be submitted to the office above within one (1) month from the sampling date or 180 days from the date of this permit, whichever earlier.

CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 1460, Alhambra, CA 91802 containing:

1. File number of facility and closure permit number.
2. Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.
3. Description of methods for obtaining, handling and transporting samples.
4. Time and date samples were obtained.
5. If borings were established, boring logs certified by a CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.
6. Chain-of-custody documentation initiated by person obtaining sample through person at State Department of Health Services certified laboratory.
7. Disposal destination of tanks and evidence of legal disposal.
8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.
9. Documentation as to depth of groundwater at facility.
10. Manifests to documentation hazardous waste disposal of any removed soil and rinseate.
11. Any observations of site contamination.
12. Remedial action plan to mitigate contamination.
13. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.

Attention: Ms. Nichole Long

Dear Ms. Long:

We have acted upon your verbal approval and backfilled the excavation remaining after removal of our 3,000 gallon waste oil tank.

About one-third of the backfill material was boulders and rocks - the oversize from the 1 inch screening process. The 151.68 tons of undersize was hauled to Casmalia Resources on June 19, 1989.

The screening process resulted in an estimated one-third reduction of material that had to go to disposal. Tony Palagyi of your organization's Arcadia office observed our screening operation. I wish your schedule had permitted you to check it out. I expect, however, that another opportunity will soon come up.

In the meantime, we'll be working on the details needed for completion of this project.

Thanks.!

Sincerely,

Bill Richardson
Principal Project Engineer

Dear Underground Tank Owner/Operator:

FACILITY LOCATION: 14041 E LIVE OAK
PERMIT NUMBER: 00000157 NUMBER OF TANKS: 2

The recent enactment of Federal regulations for the control and monitoring of underground storage tanks (USTs) has made it necessary for local agencies and the State Water Resources Control Board to update information on file about the USTs at your facility and the ownership of these tanks. The State has developed the enclosed Form "A" (Site) and Form "B" (Tank) to record the required information.

The enclosed forms have been preprinted with information presently on file for the subject location. Please correct any erroneous data and complete the remaining information as described on the enclosed instructions. One Form "A" is required for each location where USTs exist and one Form "B" is required for EACH TANK at that location.

The completed forms must be submitted 30 days from date of this letter to:

DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION
P.O. BOX 1460
ALHAMBRA, CA 91802-1460

This submittal is mandatory to maintain your UST permit

There is no fee required for this submittal. However, if there are USTs at this location that were not previously registered, you will be liable for additional permit and State surcharge fees. If some or all of the USTs shown for this location have been closed, so indicate on Form "B" and include the Closure Permit number on your submittal. Please note that USTs permitted for closure will remain on the record until ALL required post-closure information has been submitted and approved.

Your cooperation will greatly assist State and local compliance with UST regulations. Please contact the Waste Management Division, UST Unit, at (818) 458-3517 if you have any questions or need additional forms.

Very truly yours:

T. A. TIDEMANSON
Director of Public Works

Attention: John Awuja

Dear John:

Here is a chronology of events concerning the removal of the 500 gallon concrete sump and 3000 gallon steel tank that had been used for waste oil collection and storage.

4-10-87	HMUSP No. 157 (includes waste oil sump as tank No. 8)
10-5-87	Test Boring Report (Hydrosolutions)
8-2-88	Permit 4654B pulled for 500 gallon concrete drain oil sump
1-12-89	Discovery of 3000 gallon steel tank
3-16-89	Permit 5418B for 3000 gallon steel tank only (pulled by Rudy's)
*3-31-89	Tank cleaned, inspected and removed soil samples S1 and S2 collected
4-13/14-89	Excavation of contaminated soil 9 samples tested by mobile lab
5-31-89	Material divided into 5 piles
*6-1-89	Each pile sampled
*6-15/16-89	All material screened
6-19-89	Fines (-1 inch) hauled to Casmalia
6-19/23-89	Excavation backfilled
6-26-89	Letter to Nichole
7-14-89	Report from Terra-Tech
8-1-89	Discovered permit 5418B covered only 3000 gallon tank

*Tony Palagyi of your Arcadia office was present

+68149

P.O. Box 429 • Baldwin Park, California 91706 • Telephone (818) 337-1211

The physical arrangements of the waste-oil collection system is shown in the attached sketch.

We request that a single permit be issued to cover both the sump and tank.

Sincerely,

Bill Richardson
Principal Project Engineer

FORM 'A':
SITE

UNDERGROUND STORAGE TANK PROGRAM
FACILITY/SITE, INFORMATION

INSTRUCTIONS FOR COMPLETING THIS FORM

GENERAL INSTRUCTIONS:

1. One FORM "A" shall be completed for all **NEW PERMITS, PERMIT CHANGES** or any **FACILITY/SITE INFORMATION CHANGES.**
2. **SUBMIT ONLY ONE (1) FORM "A"** for a Facility/Site, regardless of the number of tanks located at the site.
3. This form should be completed by either the **PERMIT APPLICANT.**
4. Please type or print clearly all requested information.
5. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.

I. FACILITY/SITE INFORMATION & ADDRESS - (MUST BE COMPLETED)

1. Record name and address (physical location) of the underground tank(s).
   NOTE: Address MUST have a valid physical location including city, state, and zip code.
   P.O. BOX NUMBERS ARE NOT ACCEPTABLE.
   Include nearest cross street and care of address information if appropriate.
2. Check the appropriate box for TYPE OF BUSINESS.
3. Check the appropriate box for TYPE OF BUSINESS OWNERSHIP.(ex. CORPORATION, INDIVIDUAL, etc.)
4. If Facility/Site is located on land within an indian reservation or other Indian trust lands, check the box marked "YES".
5. Phone number must have an area code. If the night number is the same, write "SAME" in proper location.
6. Record the E.P.A. ID # or write "NONE" in the space provided.
7. Indicate the NUMBER of TANKS at this SITE.

II. PROPERTY OWNER INFORMATION & ADDRESS - (MUST BE COMPLETED)

1. Complete all items in this section, unless all items are the same as SECTION 1; If the same, write **"SAME AS SITE"** across this section. Be sure to check PROPERTY OWNERSHIP TYPE box.

III. TANK OWNER INFORMATION & ADDRESS - (MUST BE COMPLETED)

1. Complete all items in this section, unless all items are the same as SECTION I; If the same, write **"SAME AS SITE"** across this section. Be sure to check TANK OWNERSHIP TYPE box.

IV. LEGAL NOTIFICATION AND BILLING ADDRESS

1. Check **ONE BOX** for the address that will be used for **BOTH LEGAL and BILLING NOTIFICATIONS.**

Applicant must sign and date form as indicated.

IT IS THE RESPONSIBLITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY/SITE TO VERIFY THE ACCURACY OF THE INFORMATION. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS:

TANK INFORMATION

INSTRUCTIONS FOR COMPLETING THIS FORM

GENERAL INSTRUCTIONS:

1. One FORM "B" shall be completed for each tank for all **NEW PERMITS, PERMIT CHANGES, TANK CLOSURES, TANK REMOVALS,** and/or any other **TANK INFORMATION CHANGE.**
2. This form should be completed by either the **PERMIT APPLICANT**
3. Please type or print clearly all requested information.
4. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.
2. Indicate the Facility/Site name where the tank is installed.
3. Is this tank a farm tank? Check 'YES' or 'NO'. A farm tank is a tank located on an agricultural farm which stores motor vehicle fuel used to propel farm vehicles.

I. TANK DESCRIPTION — COMPLETE ALL ITEMS - IF UNKNOWN - SO SPECIFY

A. Indicate owners tank ID # - If there is a tank number that is used by the owner to identify the tank.(ex. AB70789)
B. Indicate the name of the company that manufactured the tank. (ex. ACME TANK MFG.)
C. Indicate the year tank was installed. (ex. 1987)
D. Indicate the tank capacity in gallons. (ex. 25,000 or 10,000, etc.)

II TANK CONTENTS

A. 1. If MOTOR VEHICLE FUEL, check box 1 and complete items B & C.
   2. If not MOTOR VEHICLE FUEL, check the appropriate box in section A and complete items B & D.
B. Check the appropriate box.
C. Check the type of MOTOR VEHICLE FUEL. (If box 1 is checked in A)
D. Print the chemical name of the hazardous substance stored in the tank and the C.A.S. #. (Chemical Abstract Service number), if box 1 is NOT checked in A.

III. TANK CONSTRUCTION — MARK ONE ITEM ONLY IN BOX A, B, C & D

1. Check only one item in TYPE OF SYSTEM, TANK MATERIAL, INTERIOR LINING and CORROSION PROTECTION.
2. If OTHER, print in the space provided.

IV. PIPING INFORMATION

1. Circle **A** if above ground, or **U** if underground; circle both if applicable.
2. If UNKNOWN, circle or if OTHER, print in space provided.

V. LEAK DETECTION SYSTEM

1. Circle **P** for PRIMARY, or **S** for SECONDARY. A primary and/or secondary leak detection system **MUST** be circled.
2. If UNKNOWN, specify or if OTHER, print in space provided.
3. If there is no SECONDARY LEAK DETECTION SYSTEM, circle NONE.

VI. INFORMATION ON TANK PERMANENTLY CLOSED IN PLACE

1. ESTIMATED DATE LAST USED - MONTH/YEAR (January, 1988 or 01/88).
2. ESTIMATED QUANTITY of SUBSTANCE remaining in tank. (in Gallons)
3. WAS TANK FILLED WITH INERT MATERIAL? Check 'YES' or 'NO'.

Applicant must sign and date form as indicated.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY/SITE TO VERIFY THE ACCURACY OF THE INFORMATION. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS:

FORM 'B':
TANK

LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS
Waste Management Divisic
UNDERGROUND STORAGE TANK PROGRAM
TANK INFORMATION

INSTRUCTIONS FOR COMPLETING THIS FORM

GENERAL INSTRUCTIONS:

1. One FORM "B" shall be completed for each tank for all **NEW PERMITS, PERMIT CHANGES, TANK CLOSURES, TANK REMOVALS,** and/or any other **TANK INFORMATION CHANGE.**
2. This form should be completed by either the **PERMIT APPLICANT**
3. Please type or print clearly all requested information.
4. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.
2. Indicate the Facility/Site name where the tank is installed.
3. Is this tank a farm tank? Check 'YES' or 'NO'. A farm tank is a tank located on an agricultural farm which stores motor vehicle fuel used to propel farm vehicles.

I. TANK DESCRIPTION — COMPLETE ALL ITEMS - IF UNKNOWN - SO SPECIFY

A. Indicate owners tank ID # - If there is a tank number that is used by the owner to identify the tank.(ex. AB70789)
B. Indicate the name of the company that manufactured the tank. (ex. ACME TANK MFG.)
C. Indicate the year tank was installed. (ex. 1987)
D. Indicate the tank capacity in gallons. (ex. 25,000 or 10,000, etc.)

II TANK CONTENTS

A. 1. If MOTOR VEHICLE FUEL, check box 1 and complete items B & C.
   2. If not MOTOR VEHICLE FUEL, check the appropriate box in section A and complete items B & D.
B. Check the appropriate box.
C. Check the type of MOTOR VEHICLE FUEL. (if box 1 is checked in A)
D. Print the chemical name of the hazardous substance stored in the tank and the C.A.S. #. (Chemical Abstract Service number), if box 1 is NOT checked in A.

III. TANK CONSTRUCTION — MARK ONE ITEM ONLY IN BOX A, B, C & D

1. Check only one item in TYPE OF SYSTEM, TANK MATERIAL, INTERIOR LINING and CORROSION PROTECTION.
2. If OTHER, print in the space provided.

IV. PIPING INFORMATION

1. Circle **A** if above ground, or **U** if underground; circle both if applicable.
2. If UNKNOWN, circle or if OTHER, print in space provided.

V. LEAK DETECTION SYSTEM

1. Circle **P** for PRIMARY, or **S** for SECONDARY. A primary and/or secondary leak detection system **MUST** be circled.
2. If UNKNOWN, specify or if OTHER, print in space provided.
3. If there is no SECONDARY LEAK DETECTION SYSTEM, circle NONE.

VI. INFORMATION ON TANK PERMANENTLY CLOSED IN PLACE

1. ESTIMATED DATE LAST USED - MONTH/YEAR (January, 1988 or 01/88).
2. ESTIMATED QUANTITY of SUBSTANCE remaining in tank. (in Gallons)
3. WAS TANK FILLED WITH INERT MATERIAL? Check 'YES' or 'NO'.

Applicant must sign and date form as indicated.

IT IS THE RESPONSIBLITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY/SITE TO VERIFY THE ACCURACY OF THE INFORMATION. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS:

Mr. Bill Richardson
United Concrete Pipe
14041 East Live Oak Avenue
Baldwin Park, CA 90706

Dear Mr. Richardson:

NOTIFICATION OF RESPONSIBILITY FOR REIMBURSEMENT FOR COSTS INCURRED IN ADMINISTERING THE UNDERGROUND STORAGE TANK CLEANUP PROGRAM
SITE ADDRESS: 14041 E. LIVE OAK AVE., BALDWIN PARK, CA 91706

The purpose of this letter is to inform responsible parties that the Los Angeles County Department of Public Works has entered into an agreement with the State of California to oversee the cleanup of contaminated sites, resulting from the unauthorized release of hazardous substances from underground storage tanks. The cleanup of these sites is necessary to protect the public and environment from unnecessary exposure to hazardous chemicals.

The cleanup program developed by Los Angeles County is funded by State and Federal monies, and is subject to the reimbursement requirements associated with the use of these funds. In order to comply with the reimbursement requirement, it will be necessary to account for all time and materials expended by County staff at each cleanup site. On a routine basis, site specific amounts detailing the time and expenses expended for each site will be provided to the State. The State will then invoice the responsible party for all direct and indirect costs associated with the cleanup of the site.

For your information, please find the enclosed Notice of Reimbursement. This is your formal notification concerning reimbursement requirements for the responsible party. If any of the information contained in the Notice of Reimbursement is incorrect, or if you have any questions regarding the reimbursement requirements, please contact Pat Proano from the Underground Storage Tank Cleanup Program at (818) 458-3979. Any correspondence should be sent to:

Los Angeles County Department of Public Works
Waste Management Division
UST Pilot Program

INSPECTOR'S REPORT

TO: DAVE LOGATO DATE: 4-9-90

FROM: TONY PALAGYI FILE: 593-3X

INDUSTRY: UNITED CONCRETE PIPE
14041 LIVE OAK AVE, BALDWIN PARK

REPORT: I WAS MET ON SITE BY MR. FRITZ GOBLER OF U.C.P. TOGETHER WE INSPECTED THE FORMER TANK LOCATIONS. PHOTO #1 SHOWS THE AREA WHERE THE MOST RECENT TANKS WERE REMOVED. I HAD WITNESSED THE CLOSURE AND REMOVAL OF CONTAM. SOILS.

PHOTO #2 IS THE AREA WHERE GAS TANKS WERE REMOVED AND REPLACED. THE EXCAVATION HAS NOT BEEN ASPHALTED DUE TO U.C.P. AWAITING FINAL CLOSURE FROM US. IN LOOKING THROUGH THE FILE IT APPEARS THIS TANK FARM HAS BEEN GRANTED FINAL CLOSURE. THE NEW TANKS ARE BEING MONITORED BY A LEAK-ALERT SYSTEM.

ALSO OF INTEREST AT THIS SITE IS THE USE OF DIESEL FUEL AS A RELEASING AGENT IN THE CONCRETE PIPE MOLDS. THE AREA WHERE THIS OPERATION IS HIGHLY SUSCEPTIBLE TO CONTAMINATION. A SITE ASSESSMENT HAS BEEN DONE AND WORK ON THE AREA SHOULD COMMENCE SHORTLY. A WRITTEN REQUEST FOR COPIES OF THE SITE ASSESSMENT MAY BE IN ORDER.

Mr. Bill Richardson
United Concrete Pipe
P.O. Box 429
Baldwin Park, CA 91706

Dear Mr. Richardson:

UST PILOT PROGRAM REVIEW SHEET
HAZARDOUS MATERIALS UNDERGROUND STORAGE
TANK CLOSURE REPORT
CLOSURE PERMIT NO. 4654B AND 5418B
FACILITY: 14041 EAST LIVE OAK AVENUE

This office has reviewed the subject document(s) submitted on December 5, 1989. The comments in this letter must be addressed and submitted to this office by July 30, 1990.

In order to better evaluate the Tank Closure Report, the information indicated on the note below must be submitted.

Note: Discuss the removal (Permit No. 4654B) of the 500 gallon concrete sump which was removed March 23, 1989. Discuss the use of diesel fuel used as a releasing agent for concrete pipe molds.

You are cautioned that any contaminated soils or hazardous materials generated during the approved operation must be manifested and transported to a hazardous waste disposal facility as required by California Health and Safety Code, Division 20, Chapter 6.5, unless evidence is presented indicating that the material may be disposed of at a less restricted facility. Copies of all completed manifests shall be submitted to this office as part of the final report.

Correspondence should be submitted to the Los Angeles County Department of Public Works, UST Pilot Program, Annex Building, P.O. Box 1460, Alhambra, CA 91802-1460.

Dear Ms. Taylor:

In response to your letter of July 6, 1990, Rudy's Service Station Maintenance was contracted to remove concrete sump.

Contaminated soils or hazardous materials generated at the United Concrete Pipe, Baldwin Park site was handled by United Concrete Pipe.

Please call if you need additional information.

Respectfully,

Luis Argandona

Dear Mr. Richardson:

UST LOCAL OVERSIGHT PROGRAM REVIEW SHEET
HAZARDOUS MATERIALS UNDERGROUND STORAGE
TANK CLOSURE AT UNITED CONCRETE PIPE
CLOSURE PERMIT NO. 4654B AND 5418B
FACILITY: 14041 EAST LIVE OAK AVENUE, BALDWIN PARK

This office has reviewed the subject document submitted on October 29, 1990, dated October 18, 1990. The comments in this letter must be addressed and submitted to this office by January 3, 1991.

A wet ink signature on the report is required by a CA Registered Geologist, CA Certified Engineering Geologist, Registered Geotechnical Engineer, or a CA Registered civil Engineer with sufficient experience in soils.

You are cautioned that any contaminated soils or hazardous materials generated during the approved operation must be manifested and transported to a hazardous waste disposal facility as required by California Health and Safety Code, Division 20, Chapter 6.5, unless evidence is presented indicating that the material may be disposed of at a less restricted facility. Copies of all completed manifests shall be submitted to this office as part of the final report.

Notify Dave Lobato at (818) 458-4374 a minimum of 72 hours prior to commencing any significant investigation, remediation, or assessment activities on site. The Los Angeles County Department of Public Works may disregard the work performed if the County was not properly notified.

Correspondence should be submitted to the Los Angeles County Department of Public Works, UST Local Oversight Program, Annex Building, P. O. Box 1460, Alhambra, CA 91802-1460.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

FACILITY LOCATION: 14641 EAST LIVE OAK AVENUE, BALDWIN PARK

This office has reviewed the final report submitted on October 29, 1991. Based on the information submitted, this letter confirms the completion of site investigation and remedial action at the above site. With the provision that the information provided to this agency was accurate and representative of existing conditions, it is our position that no further action is required at this time.

Please be advised that this letter does not relieve you of any liability under the California Health and Safety Code or Water Code for past, present or future operations at this site. Nor does it relieve you of the responsibility to clean up existing, additional or previously unidentified conditions at the site which cause or threaten to cause pollution or nuisance or otherwise pose a threat to water quality or public health.

Additionally, be advised that changes in the present or proposed use of the site may require further site characterization and mitigation activity. It is the property owner's responsibility to notify this agency of any changes in report content, future contamination findings or site usage.

Any questions regarding this matter should be directed to Yvonne M. Taylor at (818) 458-3980.

Very truly yours,

WELL INVESTIGATION PROGRAM-REVIEW OF PRELIMINARY ENDANGERMENT/SITE ASSESSMENT REPORTS: (FILE NO. AB108.1643), FORMER UNITED CONCRETE PIPE CORPORATION PROPERTY AT 14041 EAST LIVE OAK AVENUE BALDWIN PARK, CA.

Board staff are in receipt of Woodward-Clyde Consultants reports, Preliminary Endangerment Assessment for the United Concrete Pipe Manufacturing Facility, (June 14, 1990), and Preliminary Site Assessment for United Concrete Pipe Manufacturing Facility, (January 19, 1989), detailing site history, hazardous waste management, mitigation and remediation. Staff also recieved a State Department of Health Services letter, Review of Preliminary Endangerment Assessment, dated June 22, 1990.

It appears the site has been adequately assessed for flammability, pH, semi-volatile organics and acute aquatic toxicity (as per State DHS letter dated June 22, 1990). However, careful review of the aforementioned documents indicates that three areas of solvent (including 1,1,1 TCA) use and storage on-site have not been adequately assessed to determine if soils and potentially ground water have been contaminated with volatile organic compounds (VOCs). The areas of concern include:

1. An asphalt-covered solvent storage area (area I) east of the former location of the laboratory and inspector's office. A portion of the area was trenched to unrecorded depth. The trench was visually inspected and screened with an organic vapor analyzer (OVA). No soil samples were taken.

2. An asphalt-concrete slab covered area (area G) west of the former location of the garage which was used for vehicle steam-cleaning. A portion of this area was trenched to an unrecorded depth, visually inspected, and screened with an OVA. Although one (1) grab soil sample (G-1) was collected at a depth of one foot, analyzed by EPA Method 8240 and showed ND this does not constitute adequate assessment of the area.

CO910948W

3. Southeast of the former location of the garage (area B) a underground 500 gallon concrete sump, 3000 gallon steel tank and associated piping were removed. Six (6) grab soil samples were collected at depths ranging from 10 feet to 17 feet below ground surface (bgs) beneath the removed steel tank. A Sample collected at 10 feet bgs and analyzed by EPA Method 8020 (but not 8010) contained 580 ppb toluene. Soil samples were not collected beneath the removed concrete sump.

Discrete, undisturbed soil samples were not collected in any of the aforementioned areas. Also, analysis for halogenated compounds by EPA Method 8010 or 8260 was not conducted on any of the soil samples, except previously mentioned soil sample G-1 (area G) which was analyzed by EPA Method 8240.

Based upon our evaluation of the above data and information presented, work will be required to determine whether soil and/or ground water may have been impacted by solvent use/storage at the former United Pipe Concrete facility. Although discrete, undisturbed soil samples, collected from properly placed borings in areas I,G, and B can be analyzed by EPA Method 8010/8020 or 8260 to assess soils for possible VOC contamination, it is recommended that a quantitative active soil gas survey be conducted to assess soils in the above mentioned areas. In either case VOC contaminated soils must be mitigated.

A workplan for conducting the required subsurface investigation (whether soil gas or discrete, undisturbed soil sampling) must be submitted to this Regional Board. A workplan utilizing discrete, undisturbed soil sampling must address all items on the enclosed WORKPLAN REQUIREMENTS FOR INITIAL SUBSURFACE SOIL INVESTIGATION. If a soil gas survey is conducted the following minimum workplan requirements must be addressed:

1. Provide a scaled map of the areas (I, G, B) and any other areas to be investigated showing locations of all previous above/below ground tanks, pumps, sumps, piping, drains, cesspools, trenches, boreholes, sample points and all proposed soil gas sample points/nodes.

2. A tight-grid, multi-depth sampling pattern should be used in all areas. Provide rationale for number, location and depth of sample points.

3. Provide a description of soil gas collection/analyses and quality assurance/quality control procedures.

4. Perform "real time" analyses of individual organic compounds with an on-site field laboratory using a gas chromatograph equipped with PID, ECD, and/or Hall detectors.

5. Obtain soil gas samples at adequate depths below ground surface to minimize any atmospheric effects.

6. Detection limits of 0.01 ppm (v/v) must be achieved by the laboratory.

7. Obtain discrete, undisturbed confirmatory soil samples, if possible, at soil gas "high" and "low" spots and analyze for VOCs by EPA Method(s) 8010/8020 or 8260 to quantitation limits (QLs) of 5-10 ug/kg.

8. Discuss soil gas survey results (include maps and/or diagrams where appropriate) and present conclusions and recommendations.

9. Provide all chain of custody documents and complete laboratory QA/QC sheets with the report.

It is suggested that the soil gas survey be initiated and concluded before any foundation work (i. e. concrete slabs) are poured for the planned site development as this would impair accessibility and incur greater cost.

You are responsible for ascertaining the qualifications of the consultant(s) whom you retain for service and for sharing the work requirements with them. Work plans should be submitted by qualified personnel. Improperly conducted investigations and results will not be approved.

Sampling procedures should take into consideration geological conditions (unconsolidated cobbles-boulders) in the general area of the subject site which may restrict sampling and/or boring.

In addition, area C (pour line) as defined in the aforementioned reports is being referred to Los Angeles County, Department of Health Services for possible investigation in accordance with their requirements.

Four copies of the work plan containing all requested information regarding areas I, G and B must be submitted to this Regional Board by **March 15, 1991.** Please remember that the work plan should not be implemented until it has been approved by Board staff.

Please contact Rick Kaumeyer at (213) 266-7622 if you have any questions concerning this matter and address all correspondence to his attention.

SUBJECT: TANK CLOSURE AT UNITED CONCRETE PIPE

Dear Ms. Taylor:

Woodward-Clyde Consultants has been requested by the Koll Company to provide the information you requested regarding the tank closure at United Concrete Pipe 14041 E. Live Oak Avenue, Baldwin Park, California 91706 (File No. I-593-3B). As discussed during the telephone conversation of 12 October 1990, this information is provided as clarification between yourself and Tom Zdeb of Woodward-Clyde regarding the removal of the 500 gallon concrete sump (Permit No. 4654B) and the 3,000 gallon storage tank (Permit No. 5418B) (see Appendix A). In addition, a brief explanation of the use of "diesel oil" as a releasing agent for concrete pipe at the facility is included. It is hoped that this information will assist you and your office in closing the files for these tanks.

A chronology of events concerning the 500 gallon sump and the 3,000 gallon tank dated 2 August 1989, was forwarded to your office on or about that date (see Appendix B). Briefly, the chronology states that the 3,000 gallon tank was discovered on 12 January 1989, sometime after the 500 gallon sump was known to exist. The "Layout of Sump and Tank" included with this chronology, shows that the 500 gallon sump was located directly above the 3,000 gallon tank. From the diagram, it appears that the sump served as some type of receiving vessel for the tank. After that time, the interconnected tanks were handled as one unit by United Concrete Pipe in regards to the excavation of contaminated soil. The last entry of the chronology dated 1 August 1989 notes "Discovered permit 5418B covered only the 3,000 gallon tank", which is reference to the fact that the 500 gallon sump was not, strictly speaking, being handled as a separate unit during excavation.

An attempt to consolidate the permits for the 500 gallon sump and the 3,000 gallon tank was made by Bill Richardson of United Concrete Pipe by telephone on 3 August 1989. His note of the conversation is included with the copy of the Permit #4654 (Appendix A). He noted that the matter (presumably the

one regrading the 500 gallon tank) was "closed out on computer by John Awuso" (spelling may be incorrect). Whether the close out was completed is unknown.

The completed Tank Closure Report, authored by Terra Tech Labs, was forwarded to your office in early December 1989. A copy of the cover letter, dated 1 December 1989 and the report dated 8 July 1989 are included as Appendix C.

The report includes the field and laboratory procedures used for the investigation and in addition contains as Appendices copies of the following:

A. Application For Closure Permit No. 5418B

B. Hazardous Waste Manifest No. 87782075 (For oil and water from tank)

C. Tank Contents Testing Results

D. Tank (Metal) Disposal Form

E. Chain-of-Custody Forms

F. Laboratory Results

G. Correspondence with Ms. Nicole Long of the Department of Public Works, regarding contaminated material reduction activities

H. Hazardous Manifests for soil removed from the combined excavation for the 500 gallon sump and the 3,000 gallon tank. Manifests 88451711, 88451712, 88451714, 88451715, 88451716.

In addition, a copy of Manifest 88451717, which was apparently omitted in some copies of the original tank closure report is included as Appendix D to this letter.

The "diesel fuel" releasing agent referenced in your letter dated 6 July 1990, should probably be more accurately called "Form oil C-572." A copy of the Material Safety Data Sheet (MSDS) for this material is supplied as Appendix E. Form oil is primarily composed of mineral oil and was used as a release agent for the concrete forms. It was applied as a thin coating on the steel surfaces of the pipe forms to prevent the concrete from adhering to the surfaces as the concrete hardened during manufacture of concrete pipe.

The primary location for these concrete form related activities was several hundred feet away from the location of the 500 gallon sump and the 3,000 gallon tank, and the activities at the two locations appear to have been unrelated with regards to the oils used.

We hope this information will be useful in assisting you and your office in completing a Final Closure for this sump and tank. If you have any questions or require additional information, pleas contact either of the undersigned at (714) 835-6886.

Very truly yours,

Attention: John Awuja

Dear John:

Here is a chronology of events concerning the removal of the 500 gallon concrete sump and 3000 gallon steel tank that had been used for waste oil collection and storage.

4-10-87	HMUSP No. 157 (includes waste oil sump as tank No. 8)
10-5-87	Test Boring Report (Hydrosolutions)
8-2-88	Permit 4654B pulled for 500 gallon concrete drain oil sump
1-12-89	Discovery of 3000 gallon steel tank
3-16-89	Permit 5418B for 3000 gallon steel tank only (pulled by Rudy's)
*3-31-89	Tank cleaned, inspected and removed soil samples S1 and S2 collected
4-13/14-89	Excavation of contaminated soil 9 samples tested by mobile lab
5-31-89	Material divided into 5 piles
*6-1-89	Each pile sampled
*6-15/16-89	All material screened
6-19-89	Fines (-1 inch) hauled to Casmalia
6-19/23-89	Excavation backfilled
6-26-89	Letter to Nichole
7-14-89	Report from Terra-Tech
8-1-89	Discovered permit 5418B covered only 3000 gallon tank

*Tony Palagyi of your Arcadia office was present

P.O. Box 429 • Baldwin Park, California 91706 • Telephone (818) 337-1211

The physical arrangements of the waste-oil collection system is shown in the attached sketch.

We request that a single permit be issued to cover both the sump and tank.

Sincerely,

Bill Richardson
Principal Project Engineer

INTRODUCTION

The United Concrete Pipe Corporation located at 14041 East Live Oak Avenue in the City of Irwindale, California had used a waste oil system consisting of a 500 gallon concrete sump piped to a 3,000 gallon steel storage tank. In order to comply with the Los Angeles County Public Works Department, Waste Management Division's underground storage tank regulations, United Concrete Pipe Corporation requested the permanent closure of this tank, including removal of the sump and all associated piping. Closure permit #5418B was issued March 16, 1989 (Appendix A). The tank and sump were removed from the ground on March 23, 1989 by Rudy's Service Station Repair and Maint., Inc. of South El Monte, California. The tank was triple rinsed and this rinsate material manifested and taken to Petroleum Recylcing Center in Signal Hill, California (Appendix B). The tank was then rendered inert and certified clean by Harbor Testing Laboratory (Appendix C). The tank was removed from the site the same day by American Metal Recycling in Ontario, California (Appendix D). Soil sampling and laboratory analyses to determine the past integrity of the tank and future use of the soil was peformed by TERRA TECH LABS, Inc. on March 31, April 13 and April 14, 1989. All excavated soil was stockpiled adjacent to the tank pit pending laboratory analyses.

PROCEDURE

Two soil samples were collected from this site on March 31, 1989. One sample each (S2 and S1) was collected from two beneath the north and south ends.

respectively, of the tank (ten feet below ground surface). See Figure 1 for sample locations. These samples were collected under the direction and supervision of Mr. Tony Palagyi, Inspector for the Los Angeles County Department of Public Works Waste Management Division.

On April 13, 1989 two additional samples (S3 and S4) were collected from four and six feet beneath the south end of the 3,000 gallon waste oil tank excavation, respectively (fourteen and sixteen feet below ground surface). One sample (SP1) was also collected from the surrounding spoils pile. See Figure 2.

On April 14, 1989 an additional six samples were collected from the tank excavation. Two samples (S5 and S6) were collected from the north and south ends of the tank excavation at a depth of approximately seventeen feet below ground surface. One sample each (NW, SW, EW and WW) was collected from the north, south, east and west walls, respectively. These wall samples were collected at a depth of sixteen feet below ground surface. See Figure 2 for sample locations. This sampling was overseen by Mr. Tony Palagyi of the Los Angeles County Department of Public Works.

The contaminated soil removed from the excavation was segregated into five spoils piles and the United Concrete Pipe Company requested that TERRA TECH LABS, Inc. return to the site to sample these spoils piles. On June 1, 1989 five samples (SP1-SP5) were collected from the site, one from each spoils pile. See Figure 3 for spoils pile locations and sample locations.

The soil samples were collected with a clean trowel that was washed with trisodium phosphate (TSP), rinsed in distilled water and air dried before each sample

was collected. The samples were packed in sterile 8 oz., open mouth glass jars until full, thus allowing no headspace. The jars were then sealed with screw-top caps containing Teflon liners, labeled, and stored in a cooler with ice to maintain laboratory storage temperatures of approximately 4 degrees Centigrade until mobile analyses could be performed. Chain-of-Custody records were completed for each sample to ensure traceability (Appendix E). These samples were collected from the center of the bucket of a backhoe and gradall after soil had been removed down to the aforementioned depths.

Visual inspection of the tank revealed no evidence of leakage or spillage. No odors or staining were evident in the tank excavation. Ground water was not observed in the tank excavation. According to the Los Angeles County Flood Control District's well # 3020G as of October 1988, the depth to ground water adjacent to this site was 159.2 feet below ground surface.

The soil samples were submitted to TERRA TECH LABS, Inc. of Huntington Beach, California on March 31, April 13, April 14, and June 1, 1989. The analysis specified and performed for the samples collected was in accordance with EPA Method 418.1. This method utilizes a solvent (Freon-113) extraction and then analysis with an infrared spectrophotometer (IR). The two original samples collected from the tank excavation (S1 and S2) were also analyzed in accordance with EPA Method 8020 for volatile aromatics.

LABORATORY RESULTS

Chemical analysis of the soil samples collected on March 31, 1989 revealed

sample S1 to have a detectable total recoverable petroleum hydrocarbon concentration of 4780 mg/kg and sample S2 to have a detectable total recoverable petroleum hydrocarbon concentration of 33.1 mg/kg. Sample S2 revealed no detectable volatile aromatic concentrations and sample S1 revealed no detectable benzene, ethylbenzene or total xylene concentrations. Sample S1 revealed a very low detectable level of toluene (0.58 mg/kg). According to the Los Angeles County Department of Public Works, the generally accepted action limit for petroleum hydrocarbons is 100 mg/kg. Therefore, further excavating, sampling and analyses were performed on April 13 and 14, 1989.

Chemical analysis of the two samples (S3 and S4) collected from the south floor of the tank excavation on April 13, 1989 revealed total recoverable petroleum hydrocarbon concentrations of 259 and 202 mg/kg, respectively. The spoils pile sample collected on this date revealed a total recoverable petroleum hydrocarbon concentration of 318 mg/kg. Since these soil samples exceeded the action limit, additional samples were required. Chemical analysis of the six samples (S5, S6, NW, SW, EW and WW) collected on April 14, 1989 revealed total recoverable petroleum hydrocarbon concentrations of ND, 77.7 mg/kg, ND, 30.4 mg/kg, ND and 93.8 mg/kg, respectively (where ND means not detected at 1.0 mg/kg). These samples were not analyzed by EPA Method 8020 for volatile aromatics because the most contaminated sample (S1) did not reveal any significant volatile aromatic concentrations. Because all of these deeper floor and wall samples revealed total recoverable petroleum hydrocarbon concentrations less than the generally accepted action level of 100 mg/kg,

TERRA TECH LABS, INC. AN ENVIRONMENTAL TESTING SERVICE 18371 Gothard Street, Suite G Huntington Beach, CA 92647	**FIGURE 3 - SITE PLAN** United Concrete Pipe 14041 E Live Oak Baldwin Park, CA	PROJECT NUMBER: 1026-12 DATE: 06-01-89

no further sampling or analyses were performed from the tank excavation. See Appendix F for all laboratory results.

The contaminated soil that was removed from the excavation was stockpiled adjacent to the tank excavation while disposal and treatment options are explored. Chemical analysis of the five soil samples collected from the surrounding spoils piles revealed total recoverable petroleum hydrocarbon concentrations of 545, 1500, 1150, 644 and 649 mg/kg (samples SP1-SP5, respectively). See Appendix F. United Concrete Pipe Corporation decided to haul their contaminated soil to a Class 1 Hazardous Waste Facility, but only after a waste minimization process. This waste minimization process was performed in order to remove the rocks and boulders from the soil because of the much lower surface area to weight ratio (representing contaminated soil) of the larger particles (the rocks and boulders). This process was verbally approved by Ms. Nichole Long of the Los Angeles County Department of Public Works (Appendix G). All material from the excavation was passed over a one inch opening screen powered by pneumatic vibrators. Undersize (less than one inch) material was hauled to the Class 1 landfill, while oversize (greater than one inch) material was used as part of the backfill. Approximately one hundred fifty two tons of contaminated soil was removed from this site and sent to Casmalia Resources in Casmalia, California (Appendix H).

The preceding sampling procedures were reviewed and found acceptable by a California Registered Geologist whose validation appears below:

In the event of any physical or atmospheric changes adversely affecting the STANDARD SAFETY DESIGNATIONS assigned to any of the above spaces, or if at any doubt, immediately stop all work and contact the undersigned Marine Chemist

QUALIFICATIONS: Transfer of ballast or manipulation of valves or shipyard equipment tending to alter conditions in pipe lines, tanks or compartments subject to gas accumulation, unless specifically approved in this Certificate, requires inspection and endorsement or reissue of Certificate for the spaces so affected. All lines, vents, heating coils, valves, and similarly enclosed appurtenances shall be considered "hot coils" unless otherwise specifically designated.

STANDARD SAFETY DESIGNATIONS (partial list, paraphrased from NFPA 306-1980, Subsections 1-6.1 through 1-6.4, and Subsection 5-3.2).

SAFE FOR WORKERS: Means that in the compartment or space so designated: (a) the oxygen content of the atmosphere is at least 19.5 percent by volume; and that, (b) toxic materials in the atmosphere are within permissible concentrations; and that, (c) the residues are not capable of producing toxic materials under existing atmospheric conditions while maintained as directed on the Marine Chemist's Certificate.

NOT SAFE FOR WORKERS: Means that in the compartment or space so designated, the requirements of Safe for Workers has not been met.

SAFE FOR HOT WORK: Means that in the compartment so designated: (a) oxygen content of the atmosphere is at least 19.5 percent by volume, with the exception of inerted spaces or where external hot work is to be performed; and that, (b) the concentration of flammable materials in the atmosphere is below 10 percent of the lower flammable limit; and that, (c) the residues are not capable of producing a higher concentration than permitted by (b) above under existing atmospheric conditions in the presence of fire, and while maintained as directed on the Marine Chemist's Certificate; and further, that, (d) all adjacent spaces containing or having contained flammable or combustible materials have been cleaned sufficiently to prevent the spread of fire, or are satisfactorily inerted, or, in the case of fuel tanks or lube oil tanks or engine room or fire room bilges, have been treated in accordance with the Marine Chemist's requirements.

NOT SAFE FOR HOT WORK: Means that in the compartment so designated, the requirements of Safe for Hot Work have not been met.

CHEMIST'S ENDORSEMENT. This is to certify that I have personally determined that all spaces in the foregoing list are in accordance with NFPA 306-1980 Control of Gas Hazards on Vessels and have found the condition of each to be in accordance with its assigned designation.

"The undersigned acknowledges receipt of this Certificate under Section 3-3 of NFPA 306-1980 and understands conditions and limitations under which it was issued."

This Certificate is issued on conditions existing at the time the inspection herein set forth was completed and is issued subject to compliance with all qualifications and instructions.

CONCRETE PIPE
CORPORATION

June 26, 1989

Los Angeles County
Department of Public Works
Waste Management Division
P.O. Box 1460
Alhambra, CA 91802-1460

Attention: Ms. Nichole Long

Dear Ms. Long:

We have acted upon your verbal approval and backfilled the excavation remaining after removal of our 3,000 gallon waste oil tank.

About one-third of the backfill material was boulders and rocks - the oversize from the 1 inch screening process. The 151.68 tons of undersize was hauled to Casmalia Resources on June 19, 1989.

The screening process resulted in an estimated one-third reduction of material that had to go to disposal. Tony Palagyi of your organization's Arcadia office observed our screening operation. I wish your schedule had permitted you to check it out. I expect, however, that another opportunity will soon come up.

In the meantime, we'll be working on the details needed for completion of this project.

Thanks.!

Sincerely,

Bill Richardson
Principal Project Engineer

A more detailed disclosure will be provided by FARBEST CORPORATION to qualified Medical or Industrial Hygiene personnel as privileged information upon request in case of need for specific treatment. All components of this product have been listed on the TSCA chemical substance inventory.

PHYSICAL DATA

MATERIAL IS (AT 77 F) : Liquid
APPEARANCE AND ODOR: Fluid with a mineral odor
MELTING POINT (F): NDA
BOILING POINT: NDA
pH = NDA
SPECIFIC GRAVITY: 0.9
VAPOR PRESSURE: NDA
SOLUBILITY IN WATER: Negligible

PERSONAL PROTECTIVE EQUIPMENT

RESPIRATORY PROTECTION: Use in well ventilated area, otherwise employ a NIOSH/MSHA approved respirator.
EYES AND FACE: Chemical Safety Glasses
HANDS, ARMS, AND BODY: Rubber Gloves
OTHER PROTECTIVE EQUIPMENT: As required to minimize skin contact.

EMERGENCY MEDICAL PROCEDURES

INHALATION: Remove to fresh air. Provide oxygen if breathing is difficult. Call a physician.
INGESTION: Do not induce vomiting. Call a physician.
EYE: Immediately flush with plenty of water for at least 15 minutes. Call a physician.
SKIN: Flush skin with water followed by soap and water wash. If irritation occurs, call a physician.

HEALTH AND SAFETY INFORMATION

INHALATION: Mists may cause irritation to the mucous membranes of the upper respiratory tract.
INGESTION: May cause gastric irritation or diarrhea.
SKIN: Prolonged or repeated exposure may cause skin irritation and dermatitis.
EYES: Contact may cause irritation.
CARCINOGENICITY: NONE of the components in this product are listed as a carcinogen NOR as a potential carcinogen by - IARC, NTP, OSHA, or ACGIH.

INSTRUCTIONS:

HAZARDOUS MATERIALS UNDERGROUND STORAGE PROGRAM
NEW CONSTRUCTION PLAN CLEARANCE OR PERMIT ADDENDUM APPLICATION

DO NOT USE THIS FORM FOR CLOSURE,
TRANSFER OR RENEWAL OF AN EXISTING HMUSP.

This application is for authorization to construct or modify hazardous material storage facilities ONLY. A separate Hazardous Materials Underground Storage Permit (HMUSP) is required to operate the approved system. This application will not be approved unless a valid HMUSP application is on file with the Department of Public Works.

(A) Facility name, mailing address and facility address on this form must correspond with information on Part II of the State Application for Permit to Operate Underground Storage Tank.

(B) This application must be submitted for new construction (installation of new tanks) plan clearance or addendum to an existing HMUSP. Specify the number of tanks to be installed and the total number of tanks after installation. A net increase in tanks will require additional State Surcharge fee as noted in Item (C). Existing facilities with a valid operational HMUSP need not make a separate HMUSP application.

(C) Plans and specifications submitted for a new construction plan clearance must conform to Department of Public Works' "Underground Storage of Hazardous Materials Guidelines."

In addition to the plan clearance fee, an HMUSP permit fee will be required when applying to construct a new facility. A State Surcharge fee of $55 per tank will be required for each tank that increases the net number of tanks. No refund of current year HMUSP fees due will be allowed for a net decrease in the number of tanks.

(D) Specify the type of modification or change to existing tanks. Types of modifications and changes requiring an addendum include: repair of tanks or piping, replacement of piping, change or addition of hazardous material stored, change in monitoring equipment or change in overfill protection.

(E) A fee of $120 must be submitted for each addendum.

(F) This form and each State Application for Permit to Operate Underground Storage Tank must be signed by one of the following:

1) The tank owner.
2) A principal executive officer at the level of vice-president or by an authorized representative responsible for the overall operation of the facility where the tank(s) are located.
3) A general partner proprietor.
4) A principal executive officer, ranking elected official or authorized representative of a public agency.
5) An authorized representative, including an architect or contractor responsible for the installation of the new tanks or any modifications or changes to existing tanks.

INCOMPLETE APPLICATIONS WILL NOT BE PROCESSED.

TO BE COMPLETED BY THE DEPARTMENT OF PUBLIC WORKS

PURSUANT TO SECTION 11.80.070B, LOS ANGELES COUNTY CODE, PERMISSION IS HEREE GRANTED TO PROCEED WITH THE CLOSURE DESCRIBED ABOVE SUBJECT TO THE ATTACHED CONDITIONS AND LIMITATIONS [X]. THIS PERMIT EXPIRES 180 DAYS FROM THE DATE BELOW.

T.A. TIDEMANSON
Director of Public Works

Rani Iyer Date 3/21/91

CONDITIONS A -- GENERAL

1. Closures shall be carried out such that all applicable regulations from the following agencies are complied with: Los Angeles County, Department of County Engineer-Facilities; Los Angeles County Fire Department, Fire Prevention Division or the appropriate City Fire Department; South Coast Air Quality Management District; and Los Angeles County Department of Health Services.

2. The County Engineer and Fire Departments shall be notified in advance of any closure in accordance with the following:

   a. Removal of tank shall require a three (3) business day advance notification.

   b. Permanent closure of a tank in place or a temporary closure shall require a 30 day written notification.

3. The fee is $145 for the first tank plus $30 for each additional tank.

4. All abandoned wells shall be destroyed in such a way that they will not produce water or act as a channel for interchange of water, when such interchange may result in deterioration of the quality of water in any or all water bearing formations penetrated, or present a hazard to the safety and well-being of people and animals.

5. A well destruction permit issued by the Los Angeles Department of Health Services shall be required for all wells requiring a permit for their initial construction.

6. Well destruction shall be accomplished according to methods described in the latest "Water Well Standards: State of California" by the Department of Water Resources, contained in Bulletin 74-81, December 1981, or any other methods that will provide equivalent or better protection.

7. Plans for the decontamination of a facility shall be submitted to the County Engineer for approval no later than 30 days before the commencement of such operations. Other agencies having jurisdiction shall also be notified. These agencies include the California Regional Water Quality Board, the Los Angeles County Department of Health Services, and the South Coast Air Quality Management District.

8. Decontamination shall require the following, as a minimum:

   a. Cleaning operation shall be done under the supervision of persons who understand the hazardous potential of the original liquid stored and its components.

   b. The personnel shall be sufficiently skilled to safely carry out such operations.

   c. Contaminated materials removed from such facility shall be disposed of at legal point of discharge.

   d. The operation shall be carried out in a manner that will not endanger the health of the public and the environment.

CONDITIONS B -- TEMPORARY

1. All temporary closures shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #4 -- Inspection Guide #6, "Abandonment or Removal of Underground Tanks," Part A and any other applicable parts.

2. A temporary closure shall not exceed 90 days.

CONDITIONS C -- PERMANENT, TANK(S) REMOVAL

1. All tank removals shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #4 -- Inspection Guide #6, Part B and any other applicable parts.

2. Owners/operators shall notify the Building Department having jurisdiction at the place of removal if a grading permit is necessary.

3. Removed tanks shall not be transported away from the site until an inspection to establish site integrity is carried by the County Engineer.

4. If an appointment has been arranged with a County Engineer Inspector to inspect the removal of a tank, the inspector will only wait at the site a reasonable amount of time (approximately one hour) after arriving for the removal to commence. Another closure fee may be charged if the inspector has to return to the site.

5. After inspection, tanks shall be transported to a legal disposal point.

6. If the tank had stored materials other than motor fuel, fuel oil, or waste oil, site integrity shall be demonstrated using the soil sampling and analysis procedures described in CONDITIONS D below.

7. The site shall be backfilled and recompacted to a relative compaction of 90%.

CONDITIONS D -- PERMANENT, TANK(S) IN PLACE

1. All permanent closures of tanks in place shall comply with Los Angeles County Fire Department, Fire Prevention Division, Supplement #4 -- Inspection Guide #6, Parts B or C, and any other applicable parts.

2. Owners/operators shall demonstrate part site integrity as follows:

   a. Test borings shall be steel drilled to intercept a point beneath the center of the tank, if possible. If steel drilling is not feasible, the test borings may be drilled vertically and the reasons stated in the report in 2.h. below.

   b. For single tanks, a minimum of two test borings will be required, each located on opposite sides of the tank along the major axis of the tank.

   c. For multiple tanks, as a minimum, borings shall be placed at 20 foot intervals around the tank cluster. The actual number and location of borings shall be evaluated on a case-by-case basis. Tanks separated by 20 feet or more shall be considered single tanks for the purposes of test location and placement.

   d. Soil samples shall be taken at depths of 5, 10, 20, 30 and 40 feet below grade level.

   e. A Shelby tube or a Modified California Sampler shall be utilized for taking all soil samples.

   f. Soil samples shall be capped immediately with teflon or aluminum.

   g. Soil samples shall not be extruded in the field but are to be immediately placed in a refrigerated ice chest and transported to a state certified laboratory for analysis, using suitable methods.

   h. A report containing the results of the above analysis shall be submitted to the County Engineer.

3. If the soil analysis in 2. above indicates the presence of contaminants, the County Engineer shall require a site investigation as described in Chapter 9 of the County's "Underground Storage of Hazardous Materials -- Guidelines."

4. A report shall be submitted to the County Engineer containing the results of the site investigation.

NOTICE TO CLOSURE PERMIT APPLICANTS

The South Coast Air Quality Management District (SCAQMD) has adopted Rule 1166 regulating emissions of Volatile Organic Compounds (VOC) from decontamination of soil effective August 6, 1988.

In addition to the requirements of your Closure Permit, persons excavating any underground storage tank that previously contained VOC's must:

-- Notify the SCAQMD Executive Officer by telephone at (818) 572-6195, 24 hours prior to tank excavation. 1166(c)(1)(A)

-- Monitor the excavated material during the excavation for VOC contamination. 1166(c)(1)(B)

-- When VOC contamination is detected:
  * Cease excavation
  * Cover the contaminated soil until implementation of approved mitigation measures. 1166(c)(1)(C)
  * Notify the SCAQMD Executive Officer at (818) 572-6195 within 24 hours of detection of VOC contaminated soil. 1166(c)(2)(A)

-- A person shall not engage in or allow any on-site or off-site spreading of VOC contaminated soil which results in uncontrolled evaporation of VOC to the atmosphere. 1166(c)(3)

Exemptions

-- Treatment of less than one (1) cubic yard of contaminated soil. 1166(d)(1)(A)

-- Decontamination of soil containing organic compounds that have initial boiling point of 302°F or greater, Reid Vapor Pressure less than 80mm Hg or Absolute Vapor Pressure less than 36mm Hg at 20°C. 1166(d)(1)(B).(F)

-- Removal of soil for sampling purposes pursuant to EPA methods. 1166(d)(1)(C)

-- Accidental spillage of five (5) gallons or less of VOC. 1166(d)(1)(D)

-- Decontamination of soil which is contaminated through natural seepage of VOC from oil and gas wells or other natural sources. 1166(d)(1)(E)

SPECIFIC QUESTIONS ON RULE 1166 SHOULD BE REFERRED TO THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (818) 572-6200

CLOSURE PERMIT SUPPLEMENT
HAZARDOUS MATERIALS UNDERGROUND STORAGE
LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION
900 S. FREMONT AVENUE
ALHAMBRA, CA 91803

Closure Permit No.: 7963 B
File No. I- 593 – 35

PART 1 OF 2

To satisfy the permanent closure requirements for underground storage tanks previously storing hazardous materials, site integrity must be demonstrated by the analysis of soil samples and, if applicable, groundwater samples as outlined below. These requirements are in addition to the conditions listed on the Application for Closure or contained in an approved Closure Plan.

1. Samples shall be obtained at the sampling points (SP) indicated on the attached plot plan.

2. For each SP, samples shall be obtained at the following depths:

SP	Depth(s)	Compounds	Analysis Method
1A, 1B	2-4' below tank invert	TPH + BTXE	418.1 + 8020
2A, 2B	2-4' below tank invert	TPH + BTXE	8015(M) + 8020
3, 4	2-4' under each dispenser	TPH + BTXE	8015(M) + 8020 for gasoline 418.1 + 8020 for Diesel
1 sample every 20' at the dispenser	2-4' below piping & piping starting	TPH + BTXE	8015(M) + 8020 gasoline 418.1 + 8020 Diesel.

dn4/FPERMIT Rev. 3/90

Cont'd on Page 2

3. All soil samples obtained shall be discrete, undisturbed and unexposed prior to analysis. The method used to obtain the samples and the date of sampling shall be included in the final report.

4. If groundwater is encountered during sampling, a groundwater monitoring well shall be established at the most downgradient sampling point. The well shall be developed by removing a minimum of four well volumes and a groundwater sample shall be obtained and analyzed.

5. The analytical results for all soil samples shall be expressed milligrams per kilogram (mg/kg), or micrograms per kilogram (ug/kg) as appropriate. Practical quantitation limits of 5-10 ug/kg (ppb) for volatile organics and 1 mg/kg (ppm) for the petroleum hydrocarbons must be achieved by the laboratory. Analytical results for groundwater samples shall be expressed in ug/l (ppb) and practical quantitation limits of .5-5 ug/l (ppb) for volatile organics, and 1 mg/l (ppm) for petroleum hydrocarbons must be achieved by the laboratory.

6. Analytical results shall be reported on laboratory letterhead and shall include the following information: a) The date the analysis was conducted; b) The method of extraction (if applicable); c) Detection limits for each analytical procedure and determiantion; d) The method of analysis; e) Signature of chemist certifying results.

7. All soil/groundwater samples obtained shall be handled and transported to laboratory in strict accordance with applicable EPA regulations utilizing chain-of-custody procedures. Chain-of-custody documentation shall be included in the final report.

8. If the soil/groundwater analysis indicates undefined contamination at the facility, additional sampling shall be required to define the vertical and lateral extent present.

9. A final report that contains all of the above required information shall be submitted to the office above within one (1) month from the sampling date or 180 days from the date of this permit, whichever is earlier.

ATTENTION CONTRACTOR

NOTIFICATION REQUIREMENTS

Pursuant to Los Angeles County Code, Section 11.78.045, and the Conditions and Limitations of the attached Hazardous Materials Underground Storage Closure Permit, you are required to complete ALL of the agency notifications indicated below within the time period specified prior to commencement of work on this closure.

[X] 72 HOURS - DEPARTMENT OF PUBLIC WORKS WASTE CONTROL ENGINEERING INSPECTORS:

Unless otherwise noted DPW inspectors are available at the following offices between 8:00 a.m. and 9:30 a.m. ONLY.

LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 1460, Alhambra, CA 91802-1460, containing:

1. File number of facility and closure permit number.

2 Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.

3. Description of methods for obtaining, handling, and transporting samples.

4. Time and date samples were obtained.

5. If borings were established, boring logs certified by a CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

6. Chain-of-custody documentation initiated by person obtaining sample through person at State Department of Health Services certified laboratory.

7. Disposal destination of tanks and evidence of legal disposal.

8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

9. Documentation as to depth of groundwater at facility.

10. Manifests to document hazardous waste disposal of any removed soil and tank rinsate.

11. Any observations of site contamination.

12. Remedial action plan to mitigate contamination.

13. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

GENERAL INSTRUCTIONS:

1. Use FORM "A" only to report NEW PERMITS, PLUMB CHANGES, and FACILITY/SITE INFORMATION CHANGES.
2. SUBMIT ONLY ONE (1) FORM "A" for a facility/site regardless of the number of tanks listed at the site.
3. This form should be completed by either the PERMIT APPLICANT or the LOCAL AGENCY UNDERGROUND TANK INSPECTOR.
4. Please type or print clearly all requested information.
   Use a ballpoint pen if printing or if typewriter is unavailable.

"X" ONE BOX ON FORM. "MARK ONLY ONE ITEM"

1. Mark an (X) in the box to the right of the action that corresponds to the purpose for which this form is being completed.

I. FACILITY/SITE INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Record name and address (physical location) of the underground tank(s).
   NOTE: Address MUST have a valid physical location including number, street, and zip code.
   P.O. BOX NUMBER ARE NOT ACCEPTABLE.
   Include nearest cross street and mile post if applicable.
2. Phone number must have an area code. If you might receive calls after NAME of person to contact.
3. Check the appropriate box for TYPE OF FACILITY. If OTHER, INDIVIDUAL, or CORPORATION, INDIVIDUAL specify.
4. If Facility/Site is located on land within an Indian reservation or other Indian trust lands, check the box marked "YES".
5. Indicate the NUMBER OF TANKS at this SITE.
6. Record the E.P.A. ID # or write "NONE" in the space provided.

II. PROPERTY OWNER INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Complete all items in this section, unless all items are the same as SECTION I, if the same, write **"SAME AS SITE"** across this section. Be sure to check PROPERTY OWNERSHIP TYPE box.

III. TANK OWNER INFORMATION & ADDRESS (MUST BE COMPLETED)

1. Complete all items in this section, unless all items are the same as SECTION I. If the same, write **"SAME AS SITE"** across this section. Be sure to check TANK OWNERSHIP TYPE box.

IV. BOARD OF EQUALIZATION UST STORAGE FEE ACCOUNT NUMBER (MUST BE COMPLETED)

Your permit application will not be processed. Registration with the BOE will ensure that you will receive a quarterly storage fee return for reporting the $0.006 (6 mills) per gallon fee due on the number of gallons placed in your USTs. The BOE will code permits exempt from paying the storage fee so returns will not be sent. If you do not have an account number with the BOE or if you have any questions regarding the fee or exemptions, please call the BOE at 916-739-2582 or write to the BOE at the following address: Board of Equalization, Environmental Fees Unit, P.O. Box 942879, Sacramento, CA 94279-0001.

V. LEGAL NOTIFICATION ADDRESS

1. Check **ONE BOX** for the address that will be used for **BOTH LEGAL AND BILLING NOTIFICATIONS.**

OWNER MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The [illegible] other state for numerical and some contain an alphabet. If [illegible] please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THIS APPLICATION CANNOT BE PROCESSED IF THE BOE ACCOUNT NUMBER IS NOT FILLED IN. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

FORM B (9-90) THIS FORM MUST BE ACCOMPANIED BY A PERMIT APPLICATION - FORM A, UNLESS A CURRENT FORM A HAS BEEN FILED.

FOR00348-R4

INSTRUCTIONS FOR COMPLETING FORM "B"

GENERAL INSTRUCTIONS:

1. One FORM "B" shall be completed for each tank for all **NEW PERMITS, PERMIT CHANGES, REMOVALS** and/or any other **TANK INFORMATION CHANGE.**
2. This form should be completed by either the **PERMIT APPLICANT** or the **LOCAL AGENCY UNDERGROUND TANK INSPECTOR.**
3. Please type or print clearly all requested information.
4. Use a hard point writing instrument, you are making 3 copies

TOP OF FORM: "MARK ONLY ONE ITEM"

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.
2. Indicate the DBA or Facility name where the tank is installed.

I. TANK DESCRIPTION - COMPLETE ALL ITEMS - IF UNKNOWN - SO SPECIFY

A. Indicate owners tank ID # - If there is a tank number that is used by the owner to identify the tank (ex. AB70789).
B. Indicate the name of the company that manufactured the tank (ex. ACME TANK MFG.).
C. Indicate the year the tank was installed (ex. 1987).
D. Indicate the tank capacity in gallons (ex. 25,000 or 10,000 etc.).

II. TANK CONTENTS

A. 1. If MOTOR VEHICLE FUEL, check box 1 and complete items B & C.
2. If not MOTOR VEHICLE FUEL, check the appropriate box in section A and complete items B & D.
B. Check the appropriate box.
C. Check the type of MOTOR VEHICLE FUEL (if box 1 is checked in A).
D. Print the chemical name of the hazardous substance stored in the tank and the C.A.S.#. (Chemical Abstract Service number), if box 1 is NOT checked in A.

III. TANK CONSTRUCTION - MARK ONE ITEM ONLY IN BOX A, B, C & D

1. Check only one item in TYPE OF SYSTEM, TANK MATERIAL, INTERIOR LINING and CORROSION PROTECTION.
2. If OTHER, print in the space provided.

IV. PIPING INFORMATION

1. Circle **A** if above ground; circle **U** if underground; and circle both if applicable.
2. If UNKNOWN, circle; or if OTHER, print in space provided.
3. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirement for the piping.

V. TANK LEAK DETECTION

1. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirements for the tank.

VI. INFORMATION ON TANK PERMANENTLY CLOSED IN PLACE

1. ESTIMATED DATE LAST USED - MONTH/YEAR (January, 1988 or 01/88)
2. ESTIMATED QUANTITY of HAZARDOUS SUBSTANCE remaining in the tank (in Gallons).
3. WAS TANK FILLED WITH INERT MATERIAL? Check 'Yes' or 'NO'.

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The state underground storage tank identification number is composed of the two digit county number, the three digit jurisdiction number, the six digit facility number and the six digit tank number. The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number must be the same as shown in form "A". The tank number may be assigned by the local agency; however, this number must be numerical, and cannot contain an alphabet. If the local agency prefers the State Board to assign the tank number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

WELL INVESTIGATION PROGRAM-SUBSURFACE INVESTIGATION WORKPLAN: (FILE NO. AB108.1643), FORMER UNITED CONCRETE PIPE CORPORATION PROPERTY AT 14041 EAST LIVE OAK AVENUE, BALDWIN PARK, CA

Reference is made to your consultants', Woodward-Clyde, letter dated March 15, 1991 (received March 18, 1991) transmitting the Subsurface Soil Investigation Workplan prepared for areas I, G, and B at your above indicated property in Baldwin Park.

Board staff have reviewed the workplan and agree to its implementation providing all circled numbers on the WORKPLAN REQUIREMENTS FOR INITIAL AND SUPPLEMENTARY SUBSURFACE SOIL INVESTIGATIONS (enclosed) are met and the following comments are incorporated to satisfy both site specific and general requirements:

1) Laboratory analysis of only discrete, undisturbed soil samples will be accepted. Obtain all soil samples for analysis from the middle of the sample tube.

2) All soil samples are to be analyzed for volatile organic compounds (VOCs) by EPA Method 8260 or 8010/8020, and for total petroleum hydrocarbons (TPH) by EPA Method 418.1. Quantitation limits (Qls) of 5-10 ug/kg for VOCs and 1 mg/kg for TPH must be attained.

3) Soil samples for VOCs should be analyzed within seven (7) days of collection. Samples analyzed beyond seven days may not be considered representative of site conditions.

4) The assessment report must contain all chain of custody documents and laboratory QA/QC data including: detection limits, laboratory blank, matrix spike and duplicate recoveries, the spike concentrations, laboratory control standards and extraction procedures utilized.

5) Care should be taken to insure that heavy equipment (backhoe, bulldozer) and its use needed to access sampling areas does not adversely affect soil sampling points.

6) Field personnel with appropriate qualifications in overseeing sampling activities should be on-site whenever excavation/soil sampling is to occur.

In addition, you are requested to provide copies of all correspondence between you and Los Angeles County, Department of Health Services, Los Angeles County Department of Public Works, and any other city, county, state or federal agency regarding your site.

Four copies of the Subsurface Soil Investigation results and all other requested information must be submitted to this Regional Board by **May 3, 1991.**

It is understood that excavation/soil sampling activities will commence on-site at approximately 8:00 a.m. March 27, 1991.

Please contact Rick Kaumeyer at (213) 266-7529 if you have any questions concerning this matter and address all correspondence to his attention.

T.A. TIDEMANSON
Director of Public Works

Rani Iyer 4/16/91

CONDITIONS A -- GENERAL

Closures shall be carried out such that all applicable regulations from the following agencies are complied with: Los Angeles County, Department of County Engineer-Facilities; Los Angeles County Fire Department, Fire Prevention Division or the appropriate City Fire Department; South Coast Air Quality Management District; and Los Angeles County Department of Health Services.

The County Engineer and Fire Departments shall be notified in advance of any closure in accordance with the following:

a. Removal of tank shall require a three (3) business day advance notification.

b. Permanent closure of a tank in place or a temporary closure shall require a 30 day written notification.

A fee of $30 per tank shall accompany this application.

All abandoned wells shall be destroyed in such a way that they will not produce water or act as a channel for interchange of water, when such interchange may result in deterioration of the quality of water in any or all water bearing formations penetrated, or present a hazard to the safety and well-being of people and animals.

A well destruction permit issued by the Los Angeles Department of Health Services shall be required for all wells requiring a permit for their initial construction.

Well destruction shall be accomplished according to methods described in the latest "Water Well Standards: State of California" by the Department of Water Resources, contained in Bulletin 74-81, December 1981, or any other methods that will provide equivalent or better protection.

Plans for the decontamination of a facility shall be submitted to the County Engineer for approval no later than 30 days before the commencement of such operations. Other agencies having jurisdiction shall also be notified. These agencies include the California Regional Water Quality Board, the Los Angeles County Department of Health Services, and the South Coast Air Quality Management District.

Decontamination shall require the following, as a minimum:

a. Cleaning operation shall be done under the supervision of persons who understand the hazardous potential of the original liquid stored and its components.

b. The personnel shall be sufficiently skilled to safely carry out such operation.

c. Contaminated materials removed from such facility shall be disposed of at legal point of discharge.

d. The operation shall be carried out in a manner that will not endanger the health of the public and the environment.

CONDITIONS B -- TEMPORARY

All temporary closures shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, "Abandonment or Removal of Underground Tanks," Part A and any other applicable Parts.

A temporary closure shall not exceed 90 days.

CONDITIONS C -- PERMANENT, TANK(S) REMOVAL

1. All tank removals shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Part B and any other applicable Parts.

2. Owners/operators shall notify the Building Department having jurisdiction at the place of removal if a grading permit is necessary.

3. Removed tanks shall not be transported away from the site until an inspection to establish site integrity is carried by the County Engineer.

4. If an appointment has been arranged with a County Engineer Inspector to inspect the removal of a tank, the inspector will only wait at the site a reasonable amount of time (approximately one hour) after arriving for the removal to commence. Another closure fee may be charged if the inspector has to return to the site.

5. After inspection, tanks shall be transported to a legal disposal point.

6. If the tank had stored materials other than motor fuel, fuel oil, waste oil, site integrity shall be demonstrated using the soil sampling and analysis procedures described in CONDITIONS D below.

7. The site shall be backfilled and recompacted to a relative compaction of 90%.

CONDITIONS D -- PERMANENT, TANK(S) IN PLACE

1. All permanent closures of tanks in place shall comply with Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Parts B or C, and any other applicable Parts.

2. Owners/operators shall demonstrate part site integrity as follows:

   a. Test borings shall be slant drilled to intercept a point beneath the center of the tank, if possible. If slant drilling is not feasible, the test borings may be drilled vertically and the reason stated in the report in 2.h. below.

   b. For single tanks, a minimum of two test borings will be required, each located on opposite sides of the tank along the major axis of the tank.

   c. For multiple tanks, as a minimum, borings shall be placed at [illegible] foot intervals around the tank cluster. The actual number location of borings shall be evaluated on a case-by-case bas[illegible]. Tanks separated by 20 feet or more shall be considered single tanks for the purposes of test location and placement.

   d. Soil samples shall be taken at depths of 5, 10, 20, 30 and 40 feet below grade level.

   e. A Shelby Tube or a Modified California Sampler shall be utilized for taking all soil samples.

   f. Soil samples shall be capped immediately with teflon or aluminum.

   g. Soil samples shall not be extruded in the field but are to be immediately placed in a refrigerated ice chest and transported to a state certified laboratory for analysis, using suitable methods.

   h. A report containing the results of the above analysis shall be submitted to the County Engineer.

3. If the soil analysis in 2. above indicates the presence of contaminants, the County Engineer shall require a site investigation as described in Chapter V of the County's "Underground Storage of Hazardous Materials -- Guidelines."

4. A report shall be submitted to the County Engineer containing the results of the site investigation.

NOTICE TO CLOSURE PERMIT APPLICANTS

The South Coast Air Quality Management District (SCAQMD) has adopted Rule 1166 regulating emissions of Volatile Organic Compounds (VOC) from decontamination of soil effective August 6, 1988.

In addition to the requirements of your Closure Permit, persons excavating any underground storage tank that previously contained VOC's must:

-- Notify the SCAQMD Executive Officer by telephone at (818) 572-6195, 24 hours prior to tank excavation. 1166(e)(1)(A)

-- Monitor the excavated material during the excavation for VOC contamination. 1166(e)(1)(B)

-- When VOC contamination is detected:
  - Cease excavation
  - Cover the contaminated soil until implementation of approved mitigation measures. 1166(e)(1)(C)
  - Notify the SCAQMD Executive Officer at (818) 572-6195 within 24 hours of detection of VOC contaminated soil. 1166(e)(2)(A)

-- A person shall not engage in or allow any on-site or off-site spreading of VOC contaminated soil which results in uncontrolled evaporation of VOC to the atmosphere. 1166(e)(3)

Exemptions

-- Treatment of less than one (1) cubic yard of contaminated soil. 1166(e)(1)(A)

-- Decontamination of soil containing organic compounds that have initial boiling point of 302°F or greater, Reid Vapor Pressure less than 80mm Hg or Absolute Vapor Pressure less than 36mm Hg at 20°C. 1166(e)(1)(B),(F)

-- Removal of soil for sampling purposes pursuant to EPA methods. 1166(e)(1)(C)

-- Accidental spillage of five (5) gallons or less of VOC. 1166(e)(1)(D)

-- Decontamination of soil which is contaminated through natural seepage of VOC from oil and gas wells or other natural sources. 1166(e)(1)(E)

SPECIFIC QUESTIONS ON RULE 1166 SHOULD BE REFERRED TO THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (818) 572-6200

CLOSURE PERMIT SUPPLEMENT
HAZARDOUS MATERIALS UNDERGROUND STORAGE
LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION
900 S. FREMONT AVENUE
ALHAMBRA, CA 91803

Closure Permit No.: 8058 B
File No.
I- 593 - 35

PART 1 OF 2

To satisfy the permanent closure requirements for underground storage tanks previously storing hazardous materials, site integrity must be demonstrated by the analysis of soil samples and, if applicable, groundwater samples as outlined below. These requirements are in addition to the conditions listed on the Application for Closure or contained in an approved Closure Plan.

1. Samples shall be obtained at the sampling points (SP) indicated on the attached plot plan.

2. For each SP, samples shall be obtained at the following depths:

SP	Depth(s)	Compounds	Analysis Method
3A	2-4' below tank invert	TPH + BTXE	418.1 + 8020
1 sample every 20' of piping	2-4' below piping	"	"

dn4/FPERMIT Rev. 3/90

Cont'd on Page 2

3. All soil samples obtained shall be discrete, undisturbed and unexposed prior to analysis. The method used to obtain the samples and the date of sampling shall be included in the final report.

4. If groundwater is encountered during sampling, a groundwater monitoring well shall be established at the most downgradient sampling point. The well shall be developed by removing a minimum of four well volumes and a groundwater sample shall be obtained and analyzed.

5. The analytical results for all soil samples shall be expressed milligrams per kilogram (mg/kg), or micrograms per kilogram (ug/kg) as appropriate. Practical quantitation limits of 5-10 ug/kg (ppb) for volatile organics and 1 mg/kg (ppm) for the petroleum hydrocarbons must be achieved by the laboratory. Analytical results for groundwater samples shall be expressed in ug/l (ppb) and practical quantitation limits of .5-5 ug/l (ppb) for volatile organics, and 1 mg/l (ppm) for petroleum hydrocarbons must be achieved by the laboratory.

6. Analytical results shall be reported on laboratory letterhead and shall include the following information: a) The date the analysis was conducted; b) The method of extraction (if applicable); c) Detection limits for each analytical procedure and determiantion; d) The method of analysis; e) Signature of chemist certifying results.

7. All soil/groundwater samples obtained shall be handled and transported to laboratory in strict accordance with applicable EPA regulations utilizing chain-of-custody procedures. Chain-of-custody documentation shall be included in the final report.

8. If the soil/groundwater analysis indicates undefined contamination at the facility, additional sampling shall be required to define the vertical and lateral extent present.

9. A final report that contains all of the above required information shall be submitted to the office above within one (1) month from the sampling date or 180 days from the date of this permit, whichever is earlier.

ATTENTION CONTRACTOR

NOTIFICATION REQUIREMENTS

Pursuant to Los Angeles County Code, Section 11.78.045, and the Conditions and Limitations of the attached Hazardous Materials Underground Storage Closure Permit, you are required to complete ALL of the agency notifications indicated below within the time period specified prior to commencement of work on this closure.

[X] 72 HOURS - DEPARTMENT OF PUBLIC WORKS WASTE CONTROL ENGINEERING INSPECTORS:

Unless otherwise noted DPW inspectors are available at the following offices between 8:00 a.m. and 9:30 a.m. ONLY.

LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 1460, Alhambra, CA 91802-1460, containing:

1. File number of facility and closure permit number.
2. Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.
3. Description of methods for obtaining, handling and transporting samples.
4. Time and date samples were obtained.
5. If borings were established, boring logs certified by a CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.
6. Chain-of-custody documentation initiated by person obtaining sample through person at State Department of Health Services certified laboratory.
7. Disposal destination of tanks and evidence of legal disposal.
8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.
9. Documentation as to depth of groundwater at facility.
10. Manifests to document hazardous waste disposal of any removed soil.
11. Any observations of site contamination.
12. Remedial action plan to mitigate contamination.
13. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.

LOCAL AGENCY USE ONLY

THE STATE I.D. NUMBER IS COMPOSED OF THE FOUR NUMBERS BELOW

STATE I.D.#	COUNTY #	JURISDICTION #	FACILITY #	TANK #
	19	000		

PERMIT NUMBER	PERMIT APPROVED BY/DATE	PERMIT EXPIRATION DATE

FORM B (9-90) **THIS FORM MUST BE ACCOMPANIED BY A PERMIT APPLICATION - FORM A, UNLESS A CURRENT FORM A HAS BEEN FILED.**

FOR0034B-R4

INSTRUCTIONS FOR COMPLETING FORM "B"

GENERAL INSTRUCTIONS:

1. One FORM "B" shall be completed for each tank for all **NEW PERMITS, PERMIT CHANGES, REMOVALS** and/or any other **TANK INFORMATION CHANGE**.
2. This form should be completed by either the **PERMIT APPLICANT** or the **LOCAL AGENCY UNDERGROUND TANK INSPECTOR**.
3. Please type or print clearly all requested information.
4. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.
2. Indicate the DBA or Facility name where the tank is installed.

I. TANK DESCRIPTION - COMPLETE ALL ITEMS - IF UNKNOWN - SO SPECIFY

A. Indicate owners tank ID # - If there is a tank number that is used by the owner to identify the tank (ex. AH70789).
B. Indicate the name of the company that manufactured the tank (ex. ACME TANK MFG.).
C. Indicate the year the tank was installed (ex. 1987).
D. Indicate the tank capacity in gallons (ex. 25,000 or 10,000 etc.).

II. TANK CONTENTS

A. 1. If MOTOR VEHICLE FUEL, check box 1 and complete items B & C.
   2. If not MOTOR VEHICLE FUEL, check the appropriate box in section A and complete items B & D.
B. Check the appropriate box.
C. Check the type of MOTOR VEHICLE FUEL (if box 1 is checked in A).
D. Print the chemical name of the hazardous substance stored in the tank and the C.A.S.#. (Chemical Abstract Service number), if box 1 is NOT checked in A.

III. TANK CONSTRUCTION - MARK ONE ITEM ONLY IN BOX A, B, C & D

1. Check only one item in TYPE OF SYSTEM, TANK MATERIAL, INTERIOR LINING and CORROSION PROTECTION.
2. If OTHER, print in the space provided.

IV. PIPING INFORMATION

1. Circle **A** if above ground; circle **U** if underground; and circle both if applicable.
2. If UNKNOWN, circle; or if OTHER, print in space provided.
3. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirement for the piping.

V. TANK LEAK DETECTION

1. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirements for the tank.

VI. INFORMATION ON TANK PERMANENTLY CLOSED IN PLACE

1. ESTIMATED DATE LAST USED - MONTH/YEAR (January, 1988 or 01/88).
2. ESTIMATED QUANTITY of HAZARDOUS SUBSTANCE remaining in the tank (in Gallons).
3. WAS TANK FILLED WITH INERT MATERIAL? Check 'Yes' or 'NO'.

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The state underground storage tank identification number is composed of the two digit county number, the three digit jurisdiction number, the six digit facility number and the six digit tank number. The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number must be the same as shown in form "A". The tank number may be assigned by the local agency; however, this number must be numerical and cannot contain an alphabet. If the local agency prefers the State Board to assign the tank number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

INSPECTOR'S REPORT

TO: JERRY WONG DATE: 4-24-91

FROM: SERGIO S. ARVAYO FILE: I-593-35

INDUSTRY: UNITED CONCRETE PIPE
14041 E. LIVE OAK.

REPORT:

ON TUESDAY, APRIL 23, 1991, I WENT TO THE ABOVE SITE TO INSPECT A TANK PULL. THREE TANKS WERE PULLED ON THIS DAY. THE ONLY PROBLEMS I OBSERVED WERE ASSOCIATED WITH THE WASTE OIL TANK. THE 2,000 GALLON WASTE OIL TANK, WHICH WAS LOCATED ON THE NORTHEAST SIDE OF THE PROPERTY, LOOKED AS IF IT'S CONTENTS HAD CONTAMINATED THE SOIL AROUND IT. THE SOIL WAS BLACK AND LOOKED MOIST. ALSO, EVERY TIME THE BACKHOE WOULD SCRAPE THE NORTHEAST SIDE OF THE HOLE, OIL, OR SOMETHING THAT LOOKED LIKE OIL, WOULD OOZE OUT OF THE SOIL. IT LOOKED LIKE THE THE SOIL WAS BLEEDING. I DIDN'T TAKE ANY SAMPLES BECAUSE I LEFT THE SAMPLE JARS AT THE ARCADIA OFFICE. I WENT BACK TO THIS SITE THE FOLLOWING DAY, WEDNSDAY, APRIL 24, AND SAW THAT THE BACKHOE OPERATOR WAS ON SITE. I ASKED HIM IF HE COULD HELP ME OBTAIN SOME SAMPLES. HE SAID HE COULD. I TOOK TWO SAMPLES, ONE FROM THE EASTSIDE (SAMPLE #1) AND ONE FROM THE WESTSIDE OF THE TANK (SAMPLE # 2). THE SAMPLES WERE TAKEN AT A DEPTH OF 15-18 FEET BELOW GRADE.

WASTE DISCHARGE REQUIREMENTS - KOLL BUSINESS CENTER, IRWINDLE [FILE 90-60-19(91)]

You filed with this Board a report of waste discharge for land treatment of petroleum hydrocarbon contaminated soil.

We have reviewed this report, all information and data submitted for this project, and have determined that all conditions specified in "GENERAL WASTE DISCHARGE REQUIREMENTS FOR LAND TREATMENT OF HYDROCARBON CONTAMINATED SOIL", Order No. 90-148, have been met.

Enclosed are waste discharge requirements consisting of:

1. General Waste Discharge Requirements, Order No. 90-148
2. Monitoring and Reporting Program, made a part of this Order by reference.

You may begin this land treatment project in accordance with the requirements of Order No. 90-148, and are directed to submit the reports required in the Monitoring and Reporting Program No. 90-148-19. All reports submitted to this Board should reference File No. 90-60-19(91).

If you have any questions, please contact me at (213) 266-7550 or Manjulika Chakrabarti at (213) 266-7610.

MONITORING AND REPORTING PROGRAM NO. 90-148-19
FOR
LAND TREATMENT OF PETROLEUM HYDROCARBON CONTAMINATED SOIL
Koll Business Center, Irwindle
[(File No.90-60-19(91)]

The discharger shall implement this Monitoring and Reporting Program on the date of issuance of the Waste Discharge Requirements. The reports detailed in Order No. 90-148 shall be submitted as required.

The first monitoring report under this program is due on January 15, 1992. Thereafter, monitoring reports shall be submitted by the date in the following schedule:

Reporting Period	Report Due
January - March	April 15
April - June	July 15
July - September	October 15
October - December	January 15

I. GROUND WATER MONITORING

A. Groundwater monitoring wells, when required by the Executive Officer, shall be located in suitable and accessible locations down gradient from the land treatment site to serve as receiving ground water monitoring stations. In addition, at least one monitoring well shall be established upgradient of the treatment site. A proposal for the selected well(s) shall be submitted for the Exeutive Officer's approval by December 15, 1991, and shall include construction details and precise location(s). The following shall constitute the ground water monitoring program for all required wells:

Parameter	Units	Frequency
Water Elevation	(0.01 feet)	Quarterly
Total Dissolved Solids	mg/l	Quarterly
Total Petroleum Hydrocarbon (EPA 418.1 and 8015 Mod.)	ug/l	Quarterly
Priority Pollutants (EPA Method 601 & 602)	ug/l	Quarterly
pH	pH units	Quarterly

B. Monitoring wells installed on-site shall be sampled and analyzed for the constituents detailed in I-A. The wells shall be perforated in the shallow and uppermost regional aquifers. Each well shall be installed in a manner that will ensure no cross contamination between the shallow and any regional aquifers.

C. Construction details and location of any required extraction wells required for site mitigation shall be submitted for approval of the Executive Officer. The method of disposal of all extracted liquids shall be detailed.

II. LAND TREATMENT FACILITY SOIL MONITORING

A soil sampling grid shall be established for the land treatment site and the sampling locations shall be located where representative soil samples can be obtained. Soil samples shall be collected and analyzed for the following parameters:

Parameter	Units	Frequency[1]
Bacteria Plate Count	Colonies/gm	Weekly[2]
Total Hydrocarbons (EPA Method 8015)	mg/kg	Quarterly[3]
Lead	mg/kg	Quarterly[3]
Priority Pollutants (EPA Method 8020 & 8270)	ug/kg	Quarterly[3]

1. In the event the land treatment is completed prior to the due date of the first monitoring report, then final verification samples shall be collected and analyzed in lieu of the sampling frequency approved by the Executive Officer.

2. Bacteria plate count and total petroleum hydrocarbons shall be monitored weekly after beginning full-scale land treatment.

3. A final sample shall be taken of the treated soil at the end of treatment and just prior to removal and reuse.

III. GENERAL PROVISIONS FOR SAMPLING AND ANALYSIS

A. All sampling, sample preservation, and analysis shall be performed in accordance with the latest edition of "Guidelines Establishing Test Procedure for Analysis of pollutants",

promulgated by the United States Environmental Protection Agency.

B. All chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by the State Department of Health Services, or approved by the Executive Officer. No changes shall be made in sampling points without prior approval of the Executive Officer.

C. All verification sampling requires 72 hours written and verbal notice to the Board in order for staff to participate in the sampling.

D. The discharger shall maintain all sampling and analytical results, including strip charts, date, exact location, and time of sampling, date analysis were performed, name of analyst, analytical techniques used, and results of all analysis. Such result shall be retained for a minimum of three years. This period of retention shall be extended during the course of any unresolved litigation regarding this discharge or when requested by the Regional Board.

IV. SPECIFIC REPORTING REQUIREMENTS

A. The following technical reports shall be filed with the Board:

1. A "Petroleum Hydrocarbon Contamination Removal Report" shall be submitted within 15 days of removal of contaminated soil, verifying that all contaminated soil has been removed for land treatment, and including all soil verification data supporting the nature and extent of removed soil and nature and extent of contaminated soils to remain in place.

2. A "Land Treatment Completion Report" shall be submitted within 15 days of completing land treatment, verifying that biodegradation is complete for the land treatment zone. The report shall include all data collected to date verifying that cleanup levels have been met.

3. A "Final Project Completion Report" shall be submitted within 15 days of completing all final verification sampling, summarizing the final hydrocarbon contamination levels of the land treated soils, including laboratory analysis data, and indicate the quantity and the final disposition of the land

treated material. A statement, signed by a responsible official of the discharger, shall be included stating that the land treatment was completed in accordance with the requirements and provisions of Order No. 90-148 and all other signed statements required by Order No. 90-148 shall also be included.

B. Each of the three technical reports submitted shall contain the following minimum information:

1. Quantity of waste material treated during the reporting period.

2. Analytical results from any of the ground water monitoring, as required, land treatment zone soil sampling, and soil monitoring in the excavated areas.

C. All technical reports prepared for submittal to the Board shall be signed by either a California registered professional engineer, registered geologist, or certified engineering geologist.

D. For every item where the requirements are not met, the discharger shall submit a statement of the actions undertaken or proposed, together with a timetable, to bring the discharge back into full compliance with the requirements at the earliest time.

E. In reporting the monitoring data, the discharger shall arrange the data in tabular form so that the data, the constituents, and the concentrations are readily discernible. The data shall be summarized to determine compliance with waste discharge requirements and, where applicable, shall include receiving ground water observations.

F. Monitoring reports submitted to the Regional Board shall be signed by:

1. In the case of corporations, principal executive officer at least the level of Vice President or his duly authorized representative, if such representative is responsible for the overall operation of the facility from which discharge originates;

2. In the case of a partnership, a general partner;

3. In the case of a sole proprietorship, the proprietor;

4. In the case of a municipal, state or public facility, either a principal executive officer, ranking elected official, or other duly authorized employee.

Each report shall contain the following completed declaration:

" I declare under penalty of perjury that the foregoing is true and correct.

State of California
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
LOS ANGELES REGION

ORDER NO. 90-148

GENERAL WASTE DISCHARGE REQUIREMENTS FOR LAND TREATMENT OF PETROLEUM HYDROCARBON CONTAMINATED SOIL IN LOS ANGELES AND SANTA CLARA RIVER BASINS (FILE NO. 90-60)

The California Regional Water Quality Control Board, Los Angeles Region, finds:

1. Soils contaminated with high concentrations of petroleum hydrocarbon, where identified and left unmitigated, are considered to be a discharge of waste that could affect the quality of the waters of the State, as defined in Section 13260 of the California Water Code.

2. Land treatment of these soils is proving to be an efficient and economical means of mitigating the effects of such hydrocarbon contamination. The threat to waters of the State is thereby eliminated or reduced to non-significant levels of contamination and the soil rendered suitable for reclamation and reuse. Such land treatment operations involve the discharge to land of petroleum hydrocarbon contaminated soil.

3. Section 2532(b)(5) of Chapter 15, Division 3, Title 23 of the California Code of Regulations, requires that Regional Boards shall specify in Waste Discharge Requirements, the elements of land treatment programs by dischargers who treat or dispose of wastes in land treatment waste management units.

4. Each month this Board receives a large number of Reports of Waste Discharge for the land treatment of hydrocarbon contaminated soils. Such requests far exceed the capacity of staff to review and bring to the Board for adoption, individual waste discharge requirements. These circumstances create the need for an expedited system for processing the numerous requests.

5. The adoption of general waste discharge requirements would 1) simplify the application process for dischargers, 2) free up staff for higher priority work, and 3) reduce Board time involved by enabling the Executive Officer to notify the discharger, in appropriate cases, of the applicability of the general requirements adopted by the Regional Board. The vast majority of these discharges is characterized by low volume, short term discharges to land primarily for the purpose of allowing reuse of the soil during site cleanup and development.

6. These general waste discharge requirements for land treatment of up to 100,000 cubic yards of petroleum hydrocarbon contaminated soil for durations not exceeding 365 days under the direction of the Executive Officer, would benefit the public, staff and the Board through a streamlined process without loss of significant regulatory oversight.

7. The Board adopted revised Water Quality Control Plans for Santa Clara River Basin and Los Angeles River Basin on April 27, 1978 and November 27, 1978, respectively. These Water Quality Control Plans contain water quality objectives for ground water for all Hydrologic Subareas within the Region. The requirements contained in this Order, as they are met, will be in conformance with the goals of these Water Quality Control Plans.

8. All ground waters in both the Los Angeles and Santa Clara River Basins have beneficial uses which include municipal and domestic supply, agricultural supply, industrial process supply, and groundwater recharge.

9. The waste discharge requirements contained in this order would regulate such land treatment programs in accordance with Title 23, Division 3, Chapter 15, of the California Code of Regulations.

10. The issuance of Waste Discharge Requirements for the discharges subject to these general requirements is exempt from the provisions of Chapter 3 (commencing with Section 21100) of Division 13 of the Public Resources Code pursuant to one or more of the following provisions: (1) The lead agency has prepared a negative declaration

based on findings pursuant to California Code of Regulations, Title 14, Chapter 3, Section 15070 which show that there will be no significant impact on water quality; or (3) The project would effect a minor alteration to the condition of land, and is exempt in accordance with Title 14, Chapter 3, Section 15304 of the California Code of Regulation.

11. This land treatment operation is a one time, short term process, and is not anticipated to require in excess of 365 days to complete at which time these requirements will expire.

12. These general waste discharge requirements are not intended to alter any existing working arrangements relating to cleanup cases with local governmental agencies.

The Board has notified the interested agencies and persons of its intent to adopt general waste discharge requirements for land treatment projects and has provided them with an opportunity to submit their written views and recommendations.

The Board in a public meeting heard and considered all comments pertaining to the tentative requirements.

IT IS HEREBY ORDERED THAT:

A. This Order shall serve as General Waste Discharge Requirements for the temporary discharge of petroleum hydrocarbon contaminated soil to an on-site land treatment facility for land treatment processing of the soil. Upon receipt of a Report of Waste Discharge describing such a discharge, the Executive Officer shall determine if such discharge 1) involves 100,000 cubic yards or less of contaminated soil to be land treated, 2) involves a process that will bioremediate the contaminated soil to acceptable levels as determined by the Executive Officer, but not exceeding 1000 ppm, 3) will be completed within 365 days, and 4) is covered by adequate site assessment which characterizes the nature and extent of the soil contamination including sufficient water quality data, collected under the direction of an appropriate regulatory

agency, to determine the impact on ground water resulting from such soil contamination. In the event the Executive Officer so finds, he shall notify the applicant (hereinafter called the Discharger) in writing that the proposed land treatment operation is subject to this Order.

Notwithstanding the provisions of the above paragraph, appropriate cases may be brought to the Board for adoption of individual requirements when the Executive Officer deems it desirable or necessary to do so.

B. The operation of any temporary land treatment facility shall be in conformance with Title 23, Division 3, Chapter 15, of the California Code of Regulations, "Discharge of Waste To Land", including but not limited to Sections 2510; 2532(b-5); 2549; 2550; 2580; 2584; 2590 and the following special provisions:

1. Wastes discharged on-site for biodegradation by a land treatment process shall be limited to hydrocarbon contaminated soil found on site. No other waste material shall be imported for land treatment on-site. The land treatment process, which includes water, nutrients and bacterial addition to soil along with soil aeration in the treatment zone, shall be conducted in such a way that no contaminants are added to surface water or ground waters.

2. For any proposed development on-site during the land treatment, closure and post-closure period, as defined in Title 23, Division 3, Chapter 15 of the California Code of Regulations, the discharger shall submit to this Board, written notification of such development.

3. During the land treatment operations, surface runoff from the drainage area tributary to this site shall be prevented from passing over or percolating through the treatment zone. Adequate facilities shall be provided to divert all surface runoff from storms away from the treatment area.

4. The treatment zone shall be bermed in such a way that storm water falling directly on the treatment zone will be contained. Standing water within the contained treatment zone shall be pumped down immediately and

removed to treatment facilities on site or disposed of at a legal disposal site. For the purpose of this requirement, a legal point of disposal is defined as one for which waste discharge requirements have been established by a California Regional Water Quality Control Board, and which is in full compliance therewith.

5. No condition of pollution or nuisance shall be caused by the handling, treatment or reuse of the wastes or from any excavation operation conducted in association with this land treatment operation.

6. Odors from the handling, treatment or reuse of these wastes shall not be perceivable beyond the limits of the property owned or controlled by the discharger. The discharger shall demonstrate, to the satisfaction of the Executive Officer, a positive method for odor control, prior to beginning a full-scale land treatment operation.

7. All required state and local health department permits and/or variances and air quality permits and/or variances shall be obtained by the discharger prior to commencing the land treatment operation.

8. During full-scale operation of the land treatment operation, a sampling and analysis program shall be implemented, in accordance with a Monitoring and Reporting program prescribed by the Executive Officer, to verify that complete degradation and transformation of the petroleum hydrocarbon is occurring to levels approved by the Executive Officer. Reporting of this data shall comply with the Monitoring and Reporting Section of this Order.

9. Maximum land treatment zone thickness shall not exceed 18 inches or the maximum depth of penetration of the aeration equipment, whichever is less, except with prior written approval of the Executive Officer.

C. The following General Provisions Shall Apply:

1. A copy of these requirements shall be maintained at the discharge facility and be available at all times to operating personnel.

2. In the event of any change in name, ownership, or control of these land treatment facilities, the discharger shall notify this Board in writing and shall notify the succeeding owner or operator of the existence of this Order by letter, a copy of which shall be forwarded to the Board.

3. In the event the discharger is unable to comply with any of the conditions of this Order due to:

   (a) Breakdown of waste treatment equipment,

   (b) Accidents caused by human error or negligence,

   (c) Other causes such as acts of nature,

   (d) Facility operations,

   The discharger must notify this Board by telephone within 24 hours of the incident and confirm it in writing within one week of the telephone notification.

4. In accordance with Section 13260 of the California Water Code, the discharger shall file a report with this Regional Board of any material change or proposed change in the character, location or volume of the discharge.

5. In accordance with Section 13267 of the California Water Code, the discharger shall furnish, under penalty of perjury, technical monitoring program reports; such reports shall be submitted in accordance with specifications prepared by the Executive Officer, which specifications are subject to periodic revisions as may be warranted.

6. Wastes discharged or reclaimed for reuse as soil backfill shall not contain any substance in concentrations toxic to human, animal, plant, or aquatic life.

7. Any off-site disposal of wastes shall be to a legal point of disposal and in accordance with the provisions of Division 7.5 of the Water Code. A legal point of disposal is defined in item A4 above.

8. The Regional Board and other authorized representative shall be allowed:

   (a) Entry upon premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order;

   (b) Access to copy any records that are kept under the conditions of this Order;

   (c) To inspect any facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and

   (d) To photograph, sample, and monitor for the purpose of assuring compliance with this Order, or as otherwise authorized by the California Water Code.

9. Following completion of the land treatment program on site, the discharger shall, implement a land treatment facility closure plan, which complies with the requirements of Article 8, Chapter 15, Division 3, Title 23, of the California Code of Regulations. As a minimum the plan shall include but not be limited to the following:

   (a) continue all operations necessary to maximize degradation of waste constituents within the treatment zone,

   (b) continue all ground water and unsaturated zone monitoring,

   (c) continue all operations in the treatment zone to prevent runoff from the site containing waste constituents, and

   (d) maintain the precipitation and drainage control systems.

10. In accordance with Section 13263 of the Water Code, these waste discharge requirements are subject to periodic review and revision by this Regional Board.

11. These requirements do not exempt the discharger from compliance with any other laws, regulations, or ordinances which may be applicable, they do not legalize these land treatment and disposal facilities and they leave unaffected any further restraints on those facilities which may be contained in other statues or required by other regulatory agencies.

12. An appropriate Health and Safety Plan for all assessment and mitigation activities at the site shall be filed with this Board prior to commencing any land treatment activities.

E. The attached Monitoring and Reporting Program is made a requirement of the order.

F. The Waste Discharge Requirements regulating a specific short term land treatment expire 365 days after the Executive Officer has determined the applicability of this Order to the specific project.

I, Robert P. Ghirelli, Executive Officer, do hereby certify that the foregoing is a full, true and correct copy of an Order adopted by the California Regional Water Quality Control Board, Los Angeles Region on October 22, 1990.

WELL INVESTIGATION PROGRAM-INFORMATION REQUEST (FILE NO.AB108.1643) FOR PROPERTY AT 14041 EAST LIVE OAK AVENUE, IRWINDALE, CA, FORMER KOLL CO. PROPERTY, CURRENT PROPERTY OWNER HUGHES MARKETS, INC.

It has come to this Board's attention that an underground waste storage tank (UWST) was recently removed from the above referenced property under the jurisdiction of Los Angeles County Department of Public Works (LACDPW). It was indicated that soil samples were collected and analyzed, the lateral and vertical extent of contamination was, at least, partially determined and a closure report is to be prepared and submitted to LACDPW.

The objective of this agency's well investigation program is to identify and eliminate possible sources of contamination in nearby drinking water wells. This is a comprehensive program because even small discharges may have additive effects on the ground water quality in the area.

Based on the above considerations this Board respectfully requests that you submit the following information:

1) Provide a scaled map showing the location of the UWST and any associated plumbing, all soil sample points and area(s) of remediation.

2) Provide a copy of the closure report and all soil sampling analytical results.

3) Provide copies of any other subsurface investigative work completed or ongoing at your property.

4) Provide copies of all past, current and future correspondence between you and LACDPW concerning removal of the UWST, closure report(s), and remediation requirements (if applicable).

The above required information must be submitted to this Regional Board by **January 24, 1992.**

You are also requested to notify this Board of any changes at the subject property which may affect operations, property ownership, storage and handling of chemicals or processing and disposal of wastes.

C0910595 MW

You are also reminded that this Board may impose additional requirements (which may include, but not be limited to subsurface investigation/sampling and/or remediation) concerning the UWST removed from the subject property pending review of the above requested information and other pertinent data.

Please contact Rick Kaumeyer at (213) 266-7529 if you have any questions concerning this matter and address all correspondence to his attention.

WELL INVESTIGATION PROGRAM-REQUEST FOR INFORMATION-(FILE NO. AB108.1643) CONCERNING PROPERTY AT 14041 EAST LIVE OAK AVENUE, IRWINDALE, CA, FORMER UNITED PIPE CONCRETE-KOLL COMPANY PROPERTY

It has come to the attention of this Regional Board that the City of Irwindale, within the past year, has purchased a portion of the property at the above referenced address including the water (pumping) rights to an on-site production well. Additionally, it was learned, that a second well was recently discovered on-site, the condition of which is unknown.

Since the Well Investigation Program of this Regional Board is responsible for identifying and abating subsurface contamination which may impact ground water quality we respectfully request the following information regarding the subject property and the attending well(s):

1) Provide a scaled map showing the exact parcel of land which the City of Irwindale owns and the locations of the well(s).

2) Describe/discuss briefly the city's pumping rights regarding the well(s).

3) Provide a copy of the most recent ground water sampling-analytical results for both wells.

4) Provide a diagram showing the design/construction/completion of each well. Include any other pertinent information.

5) If either one or both of the wells will not be used or adequately maintained, the well(s) must be abandon per Los Angeles County, Department of Health Services-Water, Sewer, and Subdivision Program (LAC,DHS,WSSP) guidelines as soon as possible as the well(s) may provide a conduit for contamination to reach ground water. You may contact Mr. Al Bragg of LAC,DHS at (213) 881-4147 for information regarding well abandonment requirements/procedures.

C910657 94W

6) Provide information on any known contamination (soil and/or ground water), chemical spills, or subsurface investigation(s) associated with the subject property.

7) Please provide this Regional Board with copies of all correspondence between you and any other agencies regarding bringing this property into compliance with other agency's applicable guidelines/requirements.

The above required information must be submitted to this Regional Board by **January 24, 1992.**

You are also requested to notify this Board of any changes at the subject property which may effect operations, property ownership, storage and handling of chemicals or processing and disposal of wastes.

If you have any questions concerning this matter please contact Rick Kaumeyer at (213) 266-7529 and address all correspondence to his attention.

WELL INVESTIGATION PROGRAM-COPY ALL CORRESPONDENCE REQUEST, HUGHES MARKETS, (FILE NO. AB108.1711)

This is a follow-up to the meeting held at your Los Angeles County Department of Public Works (LACDPW) office on February 20, 1992, regarding the underground waste storage tank (UWST) that was recently removed, under the jurisdiction of LACDPW, from property owned by Hughes Markets, Inc. at the following address:

Contact: Mr. Norb Parseneault
Hughes Markets, Inc.
14005 East Live Oak Avenue
Irwindale, CA 90071

This Regional Board respectfully requests that your department copy us on all correspondence between you and the owner of the above referenced property regarding UWST removal, remediation/monitoring (if applicable) and closure (report/analytical results) as this Board is currently involved in an ongoing investigation of the redevelopment area which includes this site and wishes to keep informed of all additionally required or future investigations/requirements concerning the site. We also request that you consider, where appropriate, requiring soil, soil vapor and/or ground water samples be analyzed for volatile organic compounds (VOCs) and polychlorinated biphenyls (PCBs).

If you have any questions concerning this matter please contact Rick Kaumeyer at (213) 266-7529 and address all correspondence to his attention.

Mr. Norb Parsoneault
Hughes Markets
2716 San Fernando Road
Los Angeles, CA 90065

Dear Mr. Parsoneault:

UST LOCAL OVERSIGHT PROGRAM REVIEW SHEET
INVESTIGATION OF WASTE OIL TANK AND TANK CLOSURE REPORT
PREPARED BY: WOODWARD-CLYDE CONSULTANTS
REPORTS DATED: DECEMBER 1991 AND JANUARY 14, 1992
CLOSURE PERMIT NO. 8058B
LOCATION: 14041 EAST LIVE OAK BOULEVARD, IRWINDALE

C 31606

As discussed in our meeting on February 20, 1992 with Allstaire Callender of Woodward-Clyde and Richard Kaumeyer of the California Regional Water Quality Control Board, our agency is requesting additional investigation to further define the lateral limits of the petroleum contamination.

Although Boring B (drilled approximately 35 feet southeast of the tank) stepped out in the clean soil, the extent of contamination toward the northeast, southwest, and northwest remains undefined by laboratory analysis. Borings should step out into clean soil and encircle the plume.

It is understood that due to the underground utilities and the close proximity of Arrow Highway it would be difficult to drill toward the northeast. However, measures should be taken to determine the possibility of obtaining an encroachment permit to drill in the street.

Also, since it is uncertain as to the historical high groundwater level, it is advised that the investigation extend vertically to a minimum depth of 25 feet below the deepest detectable contamination. Selected soil samples should be analyzed for volatile organics and as mentioned by Richard Kaumeyer of the California Regional Water Quality Control Board soil test should be run for PCB's due to the presence of transformers on the site.

It was discussed that an in situ form of bioremediation is being considered, however, feasibility tests need to be conducted. We require that the State Department of Health Services, Office of Alternative Technologies be notified of this proposed remediation and their requirements be met prior to approval from our office. Please provide this agency with a workplan discussing the next phase of site investigation and remediation by April 30, 1992.

Notify Dave Lobato at (818) 458-4374 a minimum of 72 hours prior to commencing any significant investigation, remediation, or assessment activities on site. The Los Angeles County Department of Public Works may disregard the work performed if the County was not properly notified.

Correspondence should be submitted in duplicate to the Los Angeles County Department of Public Works, UST Local Oversight Program, Annex Building, P. O. Box 1460, Alhambra, CA 91802-1460.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

Very truly yours,

INSPECTOR'S REPORT

TO: Dave Lobato/Taylor DATE: 9-16-92

FROM: Tom CUSTARD FILE: I-593

INDUSTRY: United Concrete Pipe
14041 E. Live OAK ave., Irwindale

REPORT: This was a Scheduled oversight inspection For drilling of exploratory borings For Site assessment. No representatives From Woodward Clyde Consultants were Seen when I arrived on-site. According to Construction Manager John Navarro, The drilling was rescheduled. I was not notified previously. Much OF the area around the Former Tank area is under Construction. Proposed boring locations appeared to be marked with Stakes. (PHoto) Surface evidence OF at least three (3) Monitoring Wells were Seen. (Photo's) Two (2) of the Monitoring Wells exist near a Shallow pit. The area around the Former Waste oiL Tank does not appear to be under Construction. Several Large Soil piles are Seen in the area. No Signs of Contamination were noted.

Dear Mr. Parsoneault:

UST LOCAL OVERSIGHT PROGRAM REVIEW SHEET
WORKPLAN TO CONDUCT REMEDIAL INVESTIGATION
PREPARED BY: WOODWARD CLYDE
REPORT DATE: MAY 18, 1992
CLOSURE PERMIT NO. 8058B
LOCATION: 14041 EAST LIVE OAK AVENUE, IRWINDALE

This office has reviewed the subject document. Please be advised that prior to approval of the in-situ bioremediation project, the Department of Toxic Substances Control must be informed and a variance obtained. Please contact Paul Hadley at (916) 324-3823 for more information regarding this matter. Also, additional investigation was proposed, however, the plot plan provided by Williamson and Schmid does not clearly show the location of the former waste oil tank, previous boring locations, and proposed boring locations.

Please submit a revised plot plan to this office by October 30, 1992.

Notify Dave Lobato at (818) 458-4374 a minimum of 72 hours prior to commencing any significant investigation, remediation, or assessment activities on site. The Los Angeles County Department of Public Works may disregard the work performed if the County was not properly notified.

Correspondence should be submitted in duplicate to the Los Angeles County Department of Public Works, UST Local Oversight Program, Annex Building, P. O. Box 1460, Alhambra, CA 91802-1460.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

WELL INVESTIGATION PROGRAM-WASTE DISCHARGE REQUIREMENTS/LAND TREATMENT PROJECT CLOSURE APPROVAL FOR PROPERTY AT 14041 EAST LIVE OAK AVENUE, IRWINDALE, KOLL BUSINESS CENTER, (FILE NO. AB108.1643), [SITE CLEANUP UNIT FILE NO. 90-60-19(91)]

Board staff are in receipt of your November 9, 1992, "Final Project Completion Report on Land Treatment of Soil at Koll Business Center, Irwindale, CA", prepared by your consultant, Woodward-Clyde, requesting closure of the land treatment project. This Regional Board issued The Koll Company a land treatment permit in accordance with "GENERAL WASTE DISCHARGE REQUIREMENTS FOR LAND TREATMENT OF HYDROCARBON CONTAMINATED SOIL", Order No. 90-148 on December 3, 1991, to bio-remediate approximately 9,000 cubic yards of (primarily) hydrocarbon contaminated soil. The soil was excavated from a former settling pond located along the western boundary of the referenced property.

Soil samples collected from the settling pond during excavation were analyzed for Volatile Organic Compounds (VOCs) by EPA Method 8240, petroleum hydrocarbons (TRPH) by EPA Method 418.1, CAM metals and pH. Also, two samples were evaluated for characteristics of toxicity and semi-volatiles by EPA Method 8270.

Approximately 17,000 cubic yards of (primarily) hydrocarbon impacted soil was excavated from the former settling pond area. Subsequent screening/removal of boulders and cobbles reduced the volume of soil to be bio-remediated (at the on-site land treatment unit-LTU) to approximately 9,000 cubic yards.

Three rounds of soil sampling (in April, June, and September of 1992) were conducted at the LTU. Soil samples were analyzed for TRPH by EPA Method 418.1, TPH by EPA Method 8015, aromatic volatile organics by EPA Method 8020, total lead, pH, moisture content, nutrient concentration (nitrate, ammonia, and total phosphate) and density of hydrocarbon-degrading microorganisms. Two soil samples were collected on October 18, 1992, and analyzed for VOCs by EPA Method 8260. Also, a water sample was collected from the retention pond during March of 1992 when runoff from the LTU was present as a result of heavy rainfall.

The most recent laboratory analytical results indicate that average petroleum hydrocarbon concentrations at the LTU have decreased and currently range from 40 mg/kg to 530 mg/kg. 6 µg/kg of chloroform was the only VOC detected in soil samples collected during October 1992. No VOCs were detected in the rainwater runoff sample. Toluene (2 µg/kg) and xylene (3 µg/kg) were detected in soil samples collected during the second round of sampling (June and July of 1992), but nearly identical concentrations of these compounds were present in laboratory blank samples. Total lead concentrations were below TTLC and STLC limits.

Based upon the existing data Board staff conclude that the requirements set forth in the Land Treatment Permit No. 90-148-19 have been met and approve closure of this land treatment project.

This determination is based upon data and information developed by Woodward-Clyde and The Koll Company to date. In accordance with its legal authority if contrary information arises in the future (from continuing soil/groundwater investigations or monitoring), this Regional Board has the option of ordering additional investigation or taking other actions as deemed appropriate.

Additionally, the jurisdictional requirements of other agencies, such as the U. S. Environmental Protection Agency and the California-EPA, Department of Toxic Substance Control are in no way affected by this determination. Such agencies may choose to evaluate the situation and make their own determinations.

Please contact Rick Kaumeyer at (213) 266-7529 if you have any questions concerning this matter and address all correspondence to his attention.

RESCISSION OF WASTE DISCHARGE REQUIREMENTS -
Baldwin Park Plant (NPDES No. CA0001597; Order No. 90-018)

Reference is made to the subject waste discharge requirements and National Pollutant Discharge Elimination System (NPDES) permit adopted by this Regional Board for the discharge of wastes from the subject facility.

An on-site inspection verified that the NPDES permit is no longer necessary since the facility has been demolished and the discharge has been terminated.

In accordance with administrative procedures, this Board at a public hearing will consider the enclosed tentative order which will rescind the requirements and NPDES permit for your facility. The hearing will be held on August 23, 1993, 9:30 a.m., in the City Council Chambers at San Buenaventura City Hall, 501 Poli Street, Ventura, California.

If you have any questions, please contact Harry Nguyen at (213) 266-7618.

ORDER NO. 93-XXX

RESCINDING WASTE DISCHARGE REQUIREMENTS AND
NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMITS

The California Regional Water Quality Control Board, Los Angeles Region, finds:

1. This Regional Board has adopted waste discharge requirements for discharges to surface waters which also serve as the National Pollutant Discharge Elimination System permit for the dischargers listed below.

2. The dischargers have terminated the discharge to surface waters.

3. Board staff has verified, by inspection, that there is no longer a waste discharge to surface waters.

4. Therefore, requirements are no longer applicable and should be rescinded.

5. The rescission of waste discharge requirements for these discharges are exempt from the provisions of Chapter 3 (commencing with Section 21100) of Division 13 of the Public Resources Code in accordance with Water Code Section 13389.

By letter dated July 23, 1993, this Regional Board notified the dischargers and interested agencies and persons of its intent to conduct a public hearing to consider rescission of the subject waste discharge requirements.

The Regional Board, in a public hearing, heard and considered all testimony pertinent to the matter.

IT IS HEREBY ORDERED that the following requirements are hereby rescinded:

Discharger (NPDES No.)	Order No.	Date Adopted	Reason for Rescission
United Concrete Pipe Baldwin Park Plant (CA0001597)	90-018	1-29-90	Moved/ Demolished

TENTATIVE

ARCO Terminal Services Terminal 1, Berth 118 Long Beach Harbor (CA0000434)	88-097	9-26-88	Terminated discharge

The Executive Officer of this Regional Board, is authorized, and he is hereby directed, to certify and submit copies of this Order to the discharger, and to such individuals and governmental agencies as may have need therefor, or as may request same.

I, Robert P. Ghirelli, Executive Officer, do certify that the foregoing is a full, true and correct copy of an Order adopted by the California Regional Water Quality Control Board, Los Angeles Region on August 23, 1993.

TENTATIVE

Dear Mr. Parsoneault:

UST LOCAL OVERSIGHT PROGRAM (LOP)
LEAD AGENCY TRANSFER
CLOSURE PERMIT NO. 6058B
LOCATION: 14041 EAST LIVE OAK AVENUE, IRWINDALE

As discussed in our meeting held on February 18, 1993, between your consultant Woodward Clyde, the Regional Water Quality Control Board (RWQCB) and our agency it was concluded that the site be referred to the (RWQCB) for Lead Agency status. This was due to the concern for possible vapor transport and the sensitivity of the site location within the San Gabriel Well Investigation Program.

The site will be rejected from our LOP and no further costs will be billed to you for this project. We do request, however, that our agency be carbon copied on all reports regarding the status of the project for our records.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

SOIL BORING INVESTIGATION
FORMER HUGHES MARKET FACILITY
14041 LIVE OAK AVENUE
IRWINDALE, CALIFORNIA
URS/D&M JOB NO. 25437-160-149
FOR TA REALTY ASSOCIATES

1.0 INTRODUCTION

URS Corporation (URS) has prepared this report on behalf of TA Realty Associates and Ralphs Grocery Company that describes the results of a subsurface investigation at the former Hughes Market facility located at 14041 Live Oak Avenue. The planned activities associated with this investigation were outlined in a work plan dated August 10, 2000 (Appendix A). The activities were based on the results of a Phase I Environmental Site Assessment being conducted for the site as part of a "due diligence" evaluation prior to property sale and title transfer. The property owner contact during this phase of investigation was identified as Mr. Tab Harrison of the Ralphs Grocery Company. Mr. Harrison may be contacted by telephone at (310) 884-4083.

2.0 SITE DESCRIPTION

The former Hughes Market facility is located at 14005 East Live Oak Avenue in Irwindale, California. A vicinity map is presented as Figure 1. The site was formerly part of a larger 74-acre parcel (14041 East live Oak Avenue) that was owned and occupied by United Concrete Pipe (UCP). Ralphs Markets acquired Hughes Markets and the property is now considered excess and is in the process of being sold.

The property is located east of the San Gabriel River Channel and south of the Santa Fe Dam. The subject property is bordered to the north-northwest by Rivergrade Road, to the northeast by Arrow Highway, a vacant lot to the east, and south by Live Oak Avenue (Figure 2). The property is developed with a 2-story vacant office building, asphalt parking lots, concrete sidewalks, and landscaped with grass, shrubs and trees.

3.0 GEOLOGY AND HYDROGEOLOGY

The site is situated in the northern-central portion of the San Gabriel Valley Groundwater Basin, overlying fresh water-bearing deposits of that basin. The basin is an elongated, alluvium-filled valley extending from the central part of Los Angeles County almost to its eastern boundary. The valley is approximately 14 miles wide, and is bordered to the north by the San Gabriel Mountains and to the south by the Repetto, Puente, and the San Jose Hills. A topographic divide marks the eastern boundary of the basin, and the Raymond fault serves as the northwestern boundary. The surface area of the valley floor is approximately 100,000 acres.

Average annual precipitation in the site vicinity is approximately 14 inches, although rainfall to the north in the San Gabriel Mountains exceeds 35 inches annually. Because these mountains are composed primarily of non-water-bearing rock, local precipitation from the mountains runs off through the San Gabriel Canyon, providing sources of recharge to the water-bearing deposits underlying the valley floor in the vicinity of the site. The region's groundwater gradient from the mouth of the San Gabriel River is to the south and west.

The principal drainage in the area is the San Gabriel River, located west of the site. The riverbanks are lined with concrete. The river bottom consists of native alluvial sand and gravel deposits.

The surface deposits at the site are recent alluvium deposited in the San Gabriel River flood plain. These deposits overlie older alluvium. The central portion of the San Gabriel Valley Groundwater Basin has water-bearing deposits averaging about 1,000 feet in thickness. The alluvium that comprises the water-bearing materials in the site vicinity consists of randomly sorted, sub-rounded to well-rounded, coarse-grained deposits derived from the San Gabriel Mountains to the north. The deposits range in size from silt to 4-foot diameter boulders. The alluvium generally consists of course sands and gravel, with occasional lenses of finer-grained material deposited during low-flow cycles.

The coarseness of the sands and gravel in the alluvial deposits makes these deposits very efficient aquifers. Horizontal permeability of the deposits range from about 100 to 500 gallons per day per square foot. Vertical permeability is generally an order of magnitude lower than the horizontal values.

Ground water levels in the vicinity of the site fluctuate greatly depending on the frequency and quantity of the precipitation. The existence of a perched water-bearing zone above the primary ground water basin at the site is unlikely, due to the coarse-grained nature of the soil.

4.0 BACKGROUND

In 1991, URS (formerly known as Woodward-Clyde) was retained by Mission-Koll to decommission two 10,000-gallon steel underground storage tanks (USTs) at the former United Concrete Pipe (UCP) facility in Irwindale, California. The USTs consisted of a steel unleaded gasoline tank and a double-walled fiberglass diesel fuel tank. The tanks were removed in April 1991 under Closure Permit No. 7963B issued by the Los Angeles County Department of Public Works (LACDPW). A closure report was submitted to the LACDPW on December 20, 1991. A copy of the closure report (Woodward-Clyde Consultants, Tank Closure Report, December 20, 1991) can be found in Appendix B. LACDPW responded to the closure report with a letter dated March 1995 requesting additional sampling. There is no indication that the former owner has ever responded to this letter, or that a follow-up investigation was ever competed.

URS personnel documented the removal of the tanks and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. Soil samples were taken beneath the tanks at an approximate depth of 15 feet below ground surface (bgs) as specified by the removal permit. Soil samples collected beneath the gasoline tank were analyzed for total petroleum hydrocarbons as gasoline (TPHg) by EPA Method 8015 Modified and the samples collected beneath the diesel tank were analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) by EPA Method 418.1.

The analytical results revealed non-detect concentrations of TPHg in samples collected beneath the unleaded gasoline tank. One sample collected beneath the north end of the diesel tank contained 186 milligrams per kilogram (mg/kg) of TRPH. Additional samples were then collected beneath the diesel tank to assess the magnitude and extent of the TRPH. On May 3, 1991, samples were collected at the same location the TRPH was detected but at greater depths (20 and 25 feet) below grade. The samples taken were non-detect for TRPH but showed low levels of toluene, xylenes, and ethylbenzene.

On May 4, 1991, four additional samples were collected near the area where the original TRPH was detected. All samples were non-detect except for one sample that contained 2 micrograms per kilogram (ug/kg) of toluene. Soil removed from beneath the tank was stockpiled and later moved to another location on site in case further treatment was deemed necessary. The stockpiled soil was reported to show no sign of discoloration.

Hughes Markets acquired a portion of the property from Mission Koll and subsequently developed the property as a business office facility. A two-story office building was constructed over the

location of the former USTs. Currently the office building is unoccupied pending sale of the property.

In July 2000, URS personnel met with Mr. Iheanacho Ofo of LACDPW to discuss specific steps necessary to close the former USTs. In accordance with LACDPW guidelines, Mr. Ofo stated that further soil investigation including sampling for methyl-tertiary-butyl ether (MTBE) must be conducted before closure would be granted. On the basis of LACDPW guidelines, Mr. Ofo stated that five borings around the former UST cluster should be drilled to depths of 40 feet bgs (25 feet below the base of the UST invert) to assess the condition of the subsurface soil. Mr. Ofo stated that if no impacts from petroleum hydrocarbons were detected in the soil beneath the former tanks, then LACDPW would consider granting UST closure.

5.0 PURPOSE AND SCOPE OF SERVICES

The purpose of this investigation was to further investigate subsurface soil conditions to evaluate whether product from the former USTs had impacted deeper soil horizons beneath the site. It should be noted that this phase of work was performed as part of a "due diligence" investigation for a property sale and title transfer and, as such, proceeded without regulatory overview of the August 10, 2000 work plan. The scope of work, however, was intended to fulfill guidelines presented by the LACDPW for a UST Site Assessment Plan with the objective of LACDPW providing regulatory oversight for UST closure. The tasks completed during this investigation are summarized below.

5.1 PREPARATION FOR FIELD INVESTIGATION ACTIVITIES

Prior to conducting the subsurface investigation, URS performed the following activities:

- Prepared a site-specific health and safety plan (HASP) for this phase of work.
- Notified Underground Service Alert of the proposed investigation.
- Selected Oltmans Construction, Spectrum Geophysics, Skaggs Concrete Coring, Pacific Drilling, and Calscience Analytical laboratories as subcontractors for the investigation.

5.2 FIELD-INVESTIGATION ACTIVITIES

The subsurface field investigation included the following activities:

- Conducted an on-site geophysical survey to verify utility clearances before advancing the soil borings.

- Supervised removal and re-construction of interior room walls by licensed contractor in order to provide access for drilling operations.

- Supervised concrete coring and cutting to allow drill stem access through the building foundation in the locations of the five borings.

- Advanced five hollow-stem auger borings to depths of 23 feet bgs, 40.5 feet bgs, 11 feet bgs, 36 feet bgs, and 14 feet bgs.

- Collected soil samples at 4-foot intervals, when possible, from the borings for soil classification, total organic vapor headspace measurements, and chemical analysis.

- Analyzed the soil samples for total petroleum hydrocarbons (TPH - full carbon chain); benzene, toluene, ethylbenzene, and xylenes (BTEX); methyl tertiary butyl ether (MTBE); and lead.

5.3 REPORT PREPARATION

Following the field activities, URS has prepared this summary report with the investigation results and recommendations in accordance with LACDPW guidelines.

6.0 METHODS OF INVESTIGATION

6.1 HEALTH AND SAFETY PLAN

A site-specific HASP was prepared by URS prior to conducting field activities at the site. The HASP described specific health and safety requirements and guidelines for the proposed activities. In addition, URS employees and subcontractor employees assigned to the project attended a tailgate safety meeting given by the Site Safety Officer each day that field activities were performed. A copy of the Health and Safety Plan is included in Appendix C.

6.2 UTILITY CLEARANCE

Underground Service Alert was notified at least 48 hours in advance of the proposed drilling activities. In addition, a geophysical survey was conducted by Spectrum Geophysics prior to performing subsurface work in order to identify the presence of potential utilities or underground structures. Four geophysical methods were used: magnetic; electromagnetic; ground penetrating radar (GPR); and electromagnetic line location. Magnetics and electromagnetics were used to identify underground tanks, drums and conduits. These features are detected due the ferrous and electrically conductive material of their construction. GPR was used as a follow up technology to characterize identified magnetic or electromagnetic anomalies.

An area within an approximate 10-foot radius around each boring location was surveyed. Once a proposed boring location was surveyed and cleared of utilities, the location was re-marked to denote clearance for drilling.

6.3 CONSTRUCTION ACTIVITY

Prior to initiating drilling activities Oltmans Construction, a general contractor, removed part of an exterior wall on the eastern portion of the office building and part of an interior wall in the northern portion of the office building to provide access for the drilling equipment. URS directed the contractor to remove the wall sections. Following completion of drilling activities, the walls and utilities removed were restored to original specifications.

6.4 SOIL BORING ADVANCEMENT

At each boring location, a concrete cutter equipped with a diamond-tipped hole-saw was used to cut two12-inch diameter holes through the concrete surface to expose subsurface soils. Two holes were cut at each boring location to allow for a secondary boring location in case of auger refusal in the primary location. After partially advancing soil boring SB-1, the driller and on-site geologist found it necessary to enlarge the 12-inch diameter holes to allow evacuation of the soil cuttings from the borehole and to allow the drill stem to maneuver around subsurface cobbles/boulders. Therefore, Skaggs Concrete Cutting returned to the site and cut 2' x 4'rectangular shaped holes encompassing the two 12-inch diameter holes.

Five borings, SB-1 through SB-5, were advanced to depths of 23 feet bgs, 40.5 feet bgs, 11 feet bgs, 36 feet bgs, and 14 feet bgs, respectively. Each of the soil borings were advanced until refusal was

met. Refusal of the drill stem was a result of cobble-sized hard rock that could not be penetrated by the drilling equipment. The borings were located in the area of the former dispenser island and USTs as shown on Figure 3. Drilling of the borings was performed using a hollow-stem auger, limited space-drilling rig with 6-inch outside diameter continuous-flight augers. Prior to drilling, boring locations were hand-augured to approximately 5-feet bgs to verify that there were no underground utilities.

Soil samples were collected at 4-foot intervals beginning at 4-feet bgs and continuing every four feet until auger refusal was met. The soil samples were collected using a modified California split-spoon sampler, fitted with three brass liners. The sampler was driven 18 inches (or to refusal) into undisturbed ground, by repeatedly dropping a 140-pound hammer from 30 inches above the sampler. The number of blows required to drive the sampler each 6-inches was recorded on the boring logs shown on Appendix D. Refusal is defined as requiring 50 hammer blows to advance the sampler 6 inches or less. In many instances sampler refusal was met and a sample could not be retrieved. In this case the drill stem was advanced to the next 4-foot interval and sampling continued.

Soil samples were used for measurement of headspace volatile organic compound (VOC) concentrations, describing the soil in accordance with the Unified Soil Classification System (USCS), and for chemical analysis (if selected).

Soil from the middle and top brass liners (if enough soil was available from the sampling process) was placed in a re-sealable plastic bag for approximately 15 minutes to allow VOCs in the soil to volatilize. The soil vapor was then measured by inserting a photoionization detector (PID) probe into the plastic bag. Background VOCs were measured prior to each measurement. The PID results were recorded on the boring logs as shown on Appendix D. The soil samples were visually examined, described and classified in general accordance with the USCS. Soil descriptions were recorded on the boring logs with other pertinent drilling notes.

The bottom brass liner from each sample interval was sealed and capped, labeled, and stored in a chilled cooler for delivery to the laboratory. The drilling and sampling activities were performed under the direction of Mr. Taras B. Kruk, a Registered Geologist (No 5681) and Certified Hydrogeologist (No. 469) experienced in environmental drilling and sampling. Boring logs were prepared in accordance with the URS standard format for environmental drilling. The boring logs

are included in Appendix D and contain geologic descriptions (USCS) of soil strata, sample identification numbers, blow counts, and PID readings for headspace analyses.

During drilling activities, soil cuttings were shoveled into 55-gallon drums. The drums were labeled, identifying the site name, boring number, date, and properly sealed. The soil cuttings will be disposed of in an appropriate manner.

6.5 SOIL ANALYSIS

Soil samples collected from the borings were submitted to Calscience Environmental Laboratories, Inc. (Calscience) in Garden Grove, California for analyses. Soil samples collected as feasibly close to 8, 16, 24, 32 and 40 feet were analyzed for TPH by EPA Method 8015-Modified for carbon chain to C44 and BTEX/MTBE by EPA Method 8020. Soil samples collected as feasibly close to 32 and 40 feet were additionally analyzed for lead by EPA Method 6010B. Samples not selected for analysis were held by the laboratory in the event that additional analysis was needed to confirm a "clean" zone beneath the former USTs. All samples sent to the laboratory were sealed, labeled, stored in a chilled cooler and submitted in accordance with EPA chain-of-custody field procedures. Soil samples were analyzed by Calscience on a 24-hour turn around time. It should be noted that the samples collected were not analyzed for TRPH by EPA Method 418.1 since the former USTs did not contain motor oil.

6.6 DECONTAMINATION PROCEDURES

The drill rig and augers were decontaminated by steam cleaning at the drilling company's maintenance facility prior to arriving at the site. The drilling company provided enough clean equipment for each day of drilling and sampling. They also provided a mobile steam cleaner for field decontamination of augers, and other large equipment used for drilling and/or sampling. Only properly decontaminated equipment approved by URS onsite personnel was used for drilling and sampling.

The field decontamination process for smaller (non-disposable) soil sampling equipment (i.e., split spoon sampler) consisted of wiping the equipment of excess soil, washing in a solution of non-phosphate detergent (Liquinox), and rinsing twice with de-ionized water. The equipment was cleaned prior to use, between each sample collection, and prior to leaving the site. All decontamination liquid and soil cuttings generated from drilling operations were stored in a

55-gallon Department of Transportation (DOT) approved drums, labeled, and properly sealed. URS staged the drums in the former trash dumpster area for disposal.

6.7 QUALITY ASSURANCE SAMPLES

Laboratory QA/QC samples were analyzed to identify the precision and accuracy of the laboratory measurements. Laboratory QA/QC samples consist of method blanks and matrix spike/matrix spike duplicates (MS/MSD) that are run daily as part of the laboratory's QA/QC plan. The purpose of the method blank samples is to evaluate the potential for introduction (during laboratory sample handling) of an analyte into a sample extract that is not present at detectable levels in the sample matrix. The purpose of the MS/MSD samples is to evaluate the effects of the sample matrix on the measurement methodology.

6.8 SAMPLE DOCUMENTATION AND TRACKING

Documentation of observations and data acquired in the field provide information on the acquisition of samples and also provide a permanent record of field activities. The observations and data were recorded with indelible ink on field sampling data sheets.

The information on the field sampling data sheets included the following information:

- Project name;
- Location of sample;
- Sampler's signature;
- Date and time of sample collection;
- Sample identification numbers and sample depth (if applicable);
- Description of samples (matrix sampled);
- Analysis to be performed;
- Number and volume of samples;
- Sample methods;
- Sample handling;
- Field observations; and
- Personnel and equipment present.

Changes or deletions on the field sampling data sheets were lined out with a single strike mark, initialed and dated by the person making the change, and remained legible. Sufficient information

was recorded to allow the sampling event to be reconstructed without relying on the collector's memory.

7.0 INVESTIGATIVE RESULTS

Five soil borings were advanced inside the former Hughes Market facility located at 14041 Live Oak Avenue, Irwindale, California during the time from August 14 through August 17, 2000. Boring SB-1 was drilled adjacent and south of the former underground storage tank (UST) and dispenser island location. Boring SB-2 was drilled through the approximate center of the former UST cluster location. Boring SB-3 and SB-4 were advanced adjacent and southwest, and adjacent and west, of the former UST and dispenser island location, respectively. Boring SB-5 was advanced north of the former UST and dispenser island location. The boring locations are shown on Figure 3.

The presence of cobbles resulted in difficult drilling conditions and, as such, four of the five boreholes met refusal before reaching the targeted depth of 40 feet bgs. However, URS used the best available technology (BAT) in attempting the 40-foot target depth within the former UST and dispenser island area, which we believe fulfill the regulatory requirements.

Boring SB-1 was advanced to a total depth of 23 feet bgs on the third attempt. Refusal was encountered twice at 6 feet bgs and finally at 23 feet bgs in the third location. Boring SB-1 encountered dark brown, fine sand, with coarse gravel at four feet bgs. Numerous cobble-sized rocks created refusal conditions for the split-spoon sampler at the 8-, 12-, and 16-foot depths. Brown/ greenish-gray, coarse, gravelly sand was encountered at 20 feet bgs, and drill rig refusal was met at 23 feet bgs due most probably to a boulder-sized rock. Headspace readings of the soil samples collected ranged from 9.8 to 15.2 ppm.

Boring SB-2 was advanced to a total depth of 40.5 feet bgs on the first attempt. Refusal was encountered at 40.5 feet bgs; however, the target depth set forth in the Soil Boring Investigation Workplan of 40 feet bgs was attained. Boring SB-2 encountered dark brown, gravelly, fine to coarse sand at 4 feet bgs. A cobble-sized rock created refusal conditions for the split-spoon sampler at the 8, 16-, and 20-foot depths. Light gray, gravelly, medium to coarse sand, with cobble sized fragments were encountered at 12 feet bgs. Brown, fine to coarse sand, with coarse gravel was observed in the 24-foot sample. Brown, fine to medium, sandy, gravel was encountered at 28 feet bgs while refusal of the sampler occurred at 32 feet. Olive gray/brown, gravelly, medium to coarse, sand with chips from cobble-sized rock was observed in the 36-foot sample. Sampler refusal was encountered at the 40-foot depth and eventually drill rig refusal at 40.5 feet bgs due to a cobble or boulder. Headspace readings of the soil samples collected from this borehole ranged from 1.8 to 3.4 ppm.

Boring SB-3 was advanced to a total depth of 11 feet bgs on the second attempt. Refusal was encountered once at 5 feet bgs and finally at 11 feet bgs in the second location. Boring SB-3 encountered sampler refusal at 4 feet bgs due to a granitic cobble fragment in the shoe of the sample barrel. Brown/greenish gray, fine to coarse, gravelly, sand was encountered at 8 feet bgs. Drill rig refusal occurred at 11 feet bgs in SB-3 due most probably to a cobble sized rock. The headspace reading of the soil sample collected from this borehole was 1.6 ppm.

Boring SB-4 was advanced to a total depth of 36 feet bgs on the first attempt. Boring SB-4 encountered dark brown, medium to coarse, sand, with fine gravel at 4 feet bgs, gray/greenish gray, gravel-sized, granitic, rock chips, with medium to coarse sand at 8 feet bgs, and brown, fine to coarse, sand, with fine gravel at 12 feet bgs. A cobble-sized rock created refusal conditions for the split spoon sampler at the 16-foot depth. Light brown/brown, fine to coarse sand with fine gravel was encountered at 20 and 24 feet bgs. Sampler refusal occurred at the 28- and 36-foot depths. Brown, medium to coarse sand with fine gravel was observed in the 32-foot sample. Drill rig refusal occurred at 36 feet bgs due most probably to a cobble-sized rock. Headspace readings of the soil samples collected from this borehole ranged from 1.5 to 14.3 ppm.

Boring SB-5 was advanced to a total depth of 14 feet bgs on the second attempt. Refusal was encountered once at 12 feet bgs and finally at 14 feet bgs in the second location. Boring SB-4 encountered dark brown, fine to coarse, sand, with fine gravel at 4 feet and 8 feet bgs. Sampler refusal was encountered at 12 feet bgs due to a cobble. Drill rig refusal occurred at 14 feet bgs in SB-5 due most probably to a cobble sized rock. Headspace readings of the soil samples collected from this borehole ranged from 10.3 to 22.4 ppm.

URS submitted the 20-foot sample from boring SB-1, the 24-foot and 36-foot samples from boring SB-2, the 8-foot sample from boring SB-3, the 8-, 24-, and 32-foot samples from SB-4, and the 8-foot sample from boring SB-5 to Calscience Environmental Laboratories, Inc. for analyses. In accordance with LACDPW guidelines, soil samples were analyzed for Total Petroleum Hydrocarbons (TPH) by EPA Method 8015-modified for carbon chain matches through C44; the volatile fuel hydrocarbon constituents BTEX by EPA 8020; and the fuel additive MTBE by EPA Method 8020. Soil samples collected as feasibly close to 32 and 40 feet were additionally analyzed for lead by EPA Method 6010B. The soil samples were analyzed on a 24-hour turnaround basis. Samples that were not selected for analysis were held by the laboratory in the event additional analyses were needed to confirm a "clean" zone beneath the former USTs. Laboratory reports and chain-of-custody records are presented in Appendix E.

PID measurements ranged from 1.5 to 22.4 parts per million by volume (ppmv). The results of TPH, BTEX, and MTBE analyses were all below method detection limits and total lead concentrations ranged from 1.35 mg/kg in SB-4 to 5.42 mg/kg in SB-1. Results of the findings are summarized in Table 1.

8.0 CONCLUSIONS AND RECOMMENDATIONS

Results of the field monitoring indicated the presence of some residual hydrocarbons in vapor-phase as measured by the PID. Results of the laboratory analyses, however, showed no indication of petroleum hydrocarbons remaining in the soil. The analytical results for lead indicated that concentrations are indicative of background lead levels in soil for the State of California (9.0 ppm to 31.0 ppm) according to the Kearney Foundation's "Special Soil Report," dated March, 1996. Based on these results, it is our opinion that no further action is required for this UST site and that formal case closure should be issued.

Re: Work Plan and Check Submittal for
Voluntary Cleanup Oversight
UST Closure Investigation
Irwindale Office Building
14005 Live Oak Avenue
Irwindale, California
URS/D&M Job No. 25437-160-149

Dear Mr. Ofo:

Please find attached, a Work Plan for a Soil Boring Investigation, and a check amounting to $535 ($401 "initial fee" and $135 one hour "maximum billed oversight fee") for entering into the Voluntary Cleanup Oversight program. These submittals are being made pursuant to our August 2, 2000 meeting at your office.

As you are aware, URS Corporation (formerly as Dames & Moore) is performing a Phase I Environmental Site Assessment for TA Realty Associates as part of a "due diligence" evaluation prior to property sale and title transfer. The current property owner contact is as follows:

Mr. Tab Harrison
Director of Environmental Affairs
Ralphs Grocery Company
P.O. Box 54143
Los Angeles, CA 90054
Phone: (310) 884-4083
FAX: (310) 884-2508

The objective of the upcoming soil boring investigation described in the attached work plan is to further investigate subsurface soil conditions and evaluate whether product from former underground storage tanks (USTs) had impacted deeper soil horizons beneath the site. It should be noted that, per our earlier discussions, this phase of work is being performed as part of a "due diligence" investigation for the property sale and title transfer and, as such, is proceeding without regulatory overview of the attached work plan. The scope of work, however, is intended to

fulfill guidelines presented by the Los Angeles County Department of Public Works (LACDPW) for a UST Site Assessment Plan with the objective of LACDPW providing regulatory oversight for UST closure. It should also be noted that the scope of work includes recent revisions that incorporate your suggestions made during our August 2, 2000 meeting.

We look forward to working with you on this project. Please feel free to contact me at (714) 433-7694 if you have any questions or comments.

Respectfully Submitted,

URS Corporation

LIST OF APPENDICES

A TASK CLOSURE REPORT (Dated December 20, 1991)

URS Corporation (URS) has been retained on behalf of TA Realty Associates and Ralphs Grocery Company to conduct a subsurface investigation at the former Hughes Market facility located at 14041 Live Oak Avenue. The proposed activities associated with this investigation are outlined below in this work plan. The activities are based on the results of an ongoing Phase I Environmental Site Assessment being conducted for the site as part of a "due diligence" evaluation prior to property sale and title transfer. The current property owner contact is identified as Mr. Tab Harrison of Ralphs Groceries. Mr. Harrison may be contacted by telephone at (310) 884-4083.

1.1 BACKGROUND

In 1991, URS was retained by Mission-Koll to decommission two 10,000-gallon steel underground storage tanks (USTs) at the former United Concrete Pipe (UCP) facility in Irwindale, California. The USTs consisted of a steel unleaded gasoline tank and a double-walled fiberglass diesel fuel tank. The tanks were removed in April 1991 under Closure Permit No. 7963B issued by the Los Angeles County Department of Public Works (LACDPW). A closure report was submitted to the LACDPW on December 20, 1991. A copy of the closure report (Woodward-Clyde Consultants, Tank Closure Report, December 20, 1991) can be found in Appendix A. LACDPW responded to the closure report with a letter dated March 1995 requesting additional sampling. There is no indication that the former owner has ever responded to this letter, or that a follow-up investigation was ever competed.

Hughes Markets acquired a portion of the property from Mission Koll and subsequently developed the property as a business office facility. A two-story office building was constructed over the location of the former USTs. Currently the office building is unoccupied pending sale of the property.

In July 2000, URS personnel met with Mr. Iheanacho Ofo of LACDPW to discuss the specific steps necessary to close the former USTs. In accordance with LACDPW guidelines, Mr. Ofo stated that further soil investigation including sampling for methyl-tertiary-butyl ether (MTBE) must be conducted before closure would be granted. The guidelines require five borings around the former UST cluster to depths of 40 feet below ground surface (bgs) (25 feet below the base of the UST invert) to assess the condition of the subsurface soil. Mr. Ofo stated that if no impacts from petroleum hydrocarbons were detected in the soil beneath the former tanks then LACDPW would consider granting UST closure.

1.2 OBJECTIVES

The objective of the investigation described in this work plan is to further investigate subsurface soil conditions to evaluate whether product from former USTs had impacted deeper soil horizons beneath the site. It should be noted that this phase of work is being performed as part of a "due diligence" investigation for a property sale and title transfer and, as such, is proceeding without regulatory overview of this work plan. The scope of work, however, is intended to fulfill guidelines presented by the LACDPW for a UST Site Assessment Plan with the objective of LACDPW to provide regulatory oversight for UST closure.

1.3 APPROACH

URS has proposed the following approach to meet the objective of the investigation:

- Perform tasks necessary to initiate field investigation
- Advance five soil borings to 40 bgs in the location of the former gasoline dispenser island and USTs to collect additional soil samples for analytical testing.
- Submit collected soil for appropriate analytical tests.
- Prepare a report describing the field activities and results of laboratory analyses.

1.4 SCOPE OF WORK

The scope of work necessary to meet the objective and approach of the investigation are outlined below, and described in detail in Sections 3 and 4.

1.4.1 Task 1: Preparation for Field Investigation Activities

Prior to conducting the subsurface investigation, URS will perform the following activities:

- Prepare/update the site-specific health and safety plan (HASP) for this phase of work.
- Notify Underground Service Alert of proposed investigation.
- Select construction, geophysics, concrete coring, drilling and analytical laboratory subcontractors.

1.4.2 Task 2: Field-Investigation Activities

The subsurface field investigation will include the following activities:

- Conduct site geophysical survey to verify utility clearances before beginning intrusive investigations.
- Supervise removal and re-construction of interior room walls by licensed contractor in order to provide access for drilling operations.
- Complete five hollow-stem auger borings to be advanced to 40 feet bgs.
- Collect soil samples at 5-foot intervals from the vadose zone during drilling of borings for soil classification, total organic vapor headspace measurements, and chemical analysis.
- Analyze the soil samples for total petroleum hydrocarbons (TPH - full carbon chain); benzene, toluene, ethylbenzene, and xylenes (BTEX); MTBE; and lead.

1.4.3 Task 3: Report Preparation

Following the field activities, URS will prepare a summary report with the investigation results and recommendations. In accordance with LACDPW guidelines, the report will include the following:

- Site information
- Facility maps
- Geology/Hydrogeology
- Boring logs
- Field sampling procedures
- Chain-of-custody records
- Laboratory results
- Waste management documentation
- Subsurface plume illustrations
- Conclusions and recommendations
- References

2.1 SITE DESCRIPTION

The former Hughes Market facility is located at 14005 East Live Oaks Avenue in Irwindale, California (Figure 1). The site was formerly part of a larger 74-acre parcel (14041 East live Oak Avenue) that was owned and occupied by United Concrete Pipe (UCP). Ralphs Markets acquired Hughes Markets and the property is now considered excess and is in the process of being sold.

The property is located east of the San Gabriel River Channel and south of the Santa Fe Dam. Rivergrade Road borders the subject property to the north-northwest, to the northeast by Arrow Highway, a vacant lot to the east and south by Live Oak Avenue (Figure 2). The property is developed with a 2-story vacant office building, asphalt parking lots, concrete sidewalks, and landscaped with grass, shrubs and trees.

2.1 GEOLOGY AND HYDROGEOLOGY

The site is situated in the north-central portion of the San Gabriel Valley Groundwater Basin, overlying fresh water-bearing deposits of that basin. The basin is an elongated, alluvium-filled valley extending from the central part of Los Angeles County almost to its eastern boundary. The valley is approximately 14 miles wide, and is bordered to the north by the San Gabriel Mountains and to the south by the Repetto, Puente, and the San Jose Hills. A topographic divide marks the eastern boundary of the basin, and the Raymond fault serves as the northwestern boundary. The surface area of the valley floor is approximately 100,000 acres.

Average annual precipitation in the site vicinity is approximately 14 inches, although rainfall to the north in the San Gabriel Mountains exceeds 35 inches annually. Because these mountains are composed primarily of non-water-bearing rock, local precipitation from the mountains runs off through the San Gabriel Canyon, providing sources of recharge to the water-bearing deposits underlying the valley floor in the vicinity of the site. The region's groundwater gradient from the mouth of the San Gabriel River is to the south and west.

The principal drainage in the area is the San Gabriel River, located west of the site. The riverbanks are lined with concrete. The river bottom consists of native alluvial sand and gravel deposits.

The surface deposits in the site are recent alluvium deposited in the San Gabriel River flood plain. These deposits overlie older alluvium. The central portion of the San Gabriel Valley Groundwater Basin has water-bearing deposits averaging about 1,000 feet in thickness. The

alluvium that comprises the water-bearing materials in the site vicinity consists of randomly sorted, subrounded to well-rounded, course-grained deposits derived from the San Gabriel Mountains to the north. The deposits range in size from silts to 4-foot diameter boulders. The alluvium generally consists of course sands and gravel, with occasional lenses of finer-grained material deposited during low-flow cycles.

The coarseness of the sands and gravel in the alluvial deposits makes these deposits very efficient aquifers. Horizontal permeability of the deposits range from about 100 to 500 gallons per day per square foot. Vertical permeability is generally an order of magnitude lower than the horizontal values.

Ground water levels in the vicinity of the site fluctuate greatly depending on the frequency and quantity of the precipitation. The existence of a perched water-bearing zone above the primary ground water basin at the site is unlikely, due to the coarse-grained nature of the soil.

2.2 SUMMARY OF PREVIOUS SITE INVESTIGATIONS

URS (formerly Woodward-Clyde) conducted a previous field investigation that consisted of the removal of two USTs at 14041 East Live Oaks Avenue in Irwindale, California. The field investigation was conducted on April 23, 1991. The two tanks consisted of a 10,000-gallon steel (unleaded) gasoline tank and a 10,000-gallon double-walled fiberglass diesel tank. A copy of the tank removal report can be found in Appendix A.

URS personnel documented the removal of the tanks and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. Soil samples were taken beneath the tanks at an approximate depth of 15 feet bgs as specified by the removal permit. Soil samples collected beneath the gasoline tank were analyzed for total petroleum hydrocarbons as gasoline (TPHg) by EPA Method 8015 Modified and the samples collected beneath the diesel tank were analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) by EPA Method 418.1.

The analytical results revealed non-detect concentrations of TPHg in samples collected beneath the unleaded gasoline tank. One sample collected beneath the north end of the diesel tank contained 186 milligrams per kilogram (mg/kg) of TRPH. Additional samples were then collected beneath the diesel tank to assess the magnitude and extent of the TRPH. On May 3, 1991, samples were collected at the same location the TRPH was detected but at greater depths (20 and 25 feet) below grade. The samples taken were non-detect for TRPH but showed low levels of toluene, xylenes, and ethylbenzenes.

On May 4, 1991, four additional samples were collected near the area were the original TRPH was detected. All samples were non-detect except for one sample that contained 2 micrograms per kilogram (ug/kg) of toluene. The soil removed beneath the tank for soil collection was stockpiled and later moved to another location on site in case further treatment was deemed necessary. The stockpiled soil was reported to show no sign of discoloration.

This section presents a discussion of pre-field activities to be conducted prior to beginning field investigation activities described in Section 4.0.

3.1 HEALTH AND SAFETY PLAN

A site-specific HASP will be prepared by URS prior to conducting field activities at the site. The HASP will describe specific health and safety requirements and guidelines for the proposed activities. In addition, URS employees and subcontractor employees assigned to the project will attend a tailgate safety meeting given by the Site Safety Officer each day that field activities are performed.

3.2 UNDERGROUND UTILITY SURVEY

Underground Service Alert will be notified at least 48 hours in advance of the proposed drilling activities. In addition, a geophysical survey will be conducted prior to performing subsurface work in order to identify the presence of potential utilities or underground structures. Four potential methods may be used: magnetic; electromagnetic; ground penetrating radar (GPR); or electromagnetic line location. Magnetics and electromagnetics are used to identify underground tanks, drums and conduits. These features are detected due the ferrous and electrically conductive material of their construction. GPR is used as a follow up technology to characterize identified magnetic or electromagnetic anomalies.

An area within an approximate 10-foot radius around the boring location will be surveyed. Once a proposed boring location is surveyed and cleared of utilities, the location will be remarked to denote clearance for drilling. If utilities are detected within the surveyed area, marking in paint on the ground will denote type of utility detected (e.g., electrical conduits) and the approximate location.

3.3 CONSTRUCTION ACTIVITY

Prior to initiating drilling activities a general contractor will remove appropriate building walls to provide access to for the drilling equipment to access the boring locations. URS will direct the contractor to the wall sections to be removed. Following completion of drilling activities the walls and utilities removed will be restored to original specifications.

This section presents a description of field activities to be performed during the site investigation.

4.1 SOIL BORING ADVANCEMENT

At each boring location, a concrete coring device equipped with a diamond-tipped circular concrete corer will be used to advance through the concrete surface.

Five borings (SB-1 through SB-5) will be advanced to a depth of 40 feet bgs or until refusal is met. The borings will be located in the area of the former dispenser island and USTs (Figure 3). Drilling of the borings will be performed using a hollow stem auger, limited space drilling rig with 6-inch outside diameter continuous-flight augers. Prior to drilling, boring locations will be hand-augured to approximately 5 feet bgs to verify that there are no underground utilities.

Soil samples will be collected at approximately 4-foot intervals beginning at 4-feet bgs and continuing to 40 feet bgs. The soil samples will be collected using a modified California split-spoon sampler, fitted with three brass liners. The sampler will be driven 18 inches (or to refusal) into undisturbed ground, by repeatedly dropping a 140-pound hammer from 30 inches above the sampler. The number of blows required to drive the sampler each 6 inches will be recorded. Refusal will be defined as requiring 50 hammer blows to advance the sampler 6 inches or less.

Soil samples will be used for measurement of head space volatile organic compound (VOC) concentration, describing the soil in accordance with the Unified Soil Classification System (USCS), and for chemical analysis (if selected).

Soil from the middle and top brass liners will be placed in a resealable plastic bag for approximately 15 minutes to allow VOCs in the soil to volatilize. The soil vapor will then be measured by inserting an organic vapor analyzer (OVA) or photoionization detector (PID) probe into the plastic bag. Background VOCs will be measured prior to each measurement. The organic vapor monitoring results will be recorded on boring logs.

The soil samples will be visually examined, described and classified in general accordance with the USCS. Soil descriptions will be recorded on the boring logs with other pertinent drilling notes.

The bottom brass liner from each sample interval will be sealed and capped, labeled, and stored in a chilled cooler for delivery to the laboratory.

A Registered Geologist or Professional Engineer experienced in environmental drilling and sampling will perform oversight of the drilling and sampling program. Boring logs will be prepared in accordance with the URS standard format for environmental drilling. At a minimum, boring logs shall contain geologic descriptions (USCS) of soil strata, depth to groundwater if encountered, depth to free product if present, sample identification numbers, blow counts, and OVA readings for headspace analyses. A Registered Geologist will review the boring logs.

During drilling activities, soil cuttings will be shoveled into 55-gallon drums. The drums will be labeled, identifying borings and depth intervals, and properly sealed or secured. Following a review of analytical soil tests the soil cuttings will be disposed at an appropriate licensed facility.

4.2 SOIL ANALYSIS

All soil samples collected from the borings will be submitted to Calscience Environmental Laboratories, Inc. (Calscience) in Garden Grove, California for analytical analyses. Soil samples collected 8, 16, 24, 32 and 40 feet will be analyzed for TPH analysis by EPA Method 8015-Modified for carbon chain to C44 and BTEX/MTBE using EPA Method 8020. Soil samples collected at 32 and 40 feet will be additionally analyzed for lead by EPA Method 6010B. Samples not selected for analysis (4, 12, 20, 28 and 36 feet) will be held by the laboratory in the event additional analysis is needed to confirm a "clean" zone beneath the former USTs. Samples showing detectable concentrations of MTBE will be confirmed by EPA Method 8260. All samples sent to the laboratory will be sealed, labeled, stored in a chilled cooler and submitted in accordance with EPA chain-of-custody field procedures. Soil samples will be analyzed by Calscience on a 24-hour turn around time. It should be noted that samples collected will not be analyzed for TRPH by EPA Method 418.1 since the former USTs did not contain motor oil.

4.3 DECONTAMINATION PROCEDURES

Drill rigs and augers will be decontaminated by steam cleaning at the drilling company's maintenance facility prior to arriving at the site. The drilling company will provide enough clean equipment for each day of drilling and sampling. They will also provide a mobile steam cleaner for field decontamination of augers, and other large equipment used for drilling and/or sampling. Only properly decontaminated equipment approved by URS Greiner Woodward Clyde onsite personnel will be used for drilling and sampling.

The field decontamination process for smaller (non-disposable) soil sampling equipment (i.e., split spoon sampler), will consist of wiping the equipment of excess soil, washing in a solution of

non-phosphate detergent (Liquinox), and rinsing with deionized water. The equipment will be cleaned prior to use, between each sample collection, and prior to leaving the site. All decontamination liquid and soil cuttings generated from drilling operations will be stored in 55-gallon Department of Transportation (DOT) approved drums, labeled, and properly sealed or secured. URS will stage the drums in an appropriate designated area for disposal.

4.4 QUALITY ASSURANCE SAMPLES

Laboratory QA/QC samples will be analyzed to identify the precision and accuracy of the laboratory measurements. Laboratory QA/QC samples consist of method blanks and matrix spike/matrix spike duplicates (MS/MSD) that are run daily as part of the laboratory's QA/QC plan. The purpose of the method blank samples is to evaluate the potential for introduction (during laboratory sample handling) of an analyte into a sample extract that is not present at detectable levels in the sample matrix. The purpose of the MS/MSD samples is to evaluate the effects of the sample matrix on the measurement methodology.

4.5 SAMPLE DOCUMENTATION AND TRACKING

Documentation of observations and data acquired in the field will provide information on the acquisition of samples and also provide a permanent record of field activities. The observations and data will be recorded with indelible ink in a permanently bound weatherproof field book with consecutively numbered pages and, if applicable, on field sampling data sheets.

The information in the field book will include the following as a minimum.

- Project name
- Location of sample
- Sampler's signature
- Date and time of sample collection
- Sample identification numbers and sample depth (if applicable)
- Description of samples (matrix sampled)
- Analysis to be performed
- Number and volume of samples
- Description of QA/QC samples (if collected)
- Sample methods

- Sample handling
- Field observations
- Personnel and equipment present

Changes or deletions in the field book should be lined out with a single strike mark, initialed and dated by person making change, and remain legible. Sufficient information should be recorded to allow the sampling event to be reconstructed without relying on the collector's memory.

URS will prepare a report of investigation following completion of field activities and laboratory analyses. The report will include a description of field activities, a summary of laboratory results in text and tabular format, conclusions and recommendations, site figures, boring logs, laboratory reports and chain-of-custody documentation, and QA/QC documentation.

SUBJECT: TANK CLOSURE REPORT
FILE NUMBER 593, PERMIT NUMBER 7963

Dear Mr. Sjoberg,

On behalf of Mission-Koll I (Koll), Woodward-Clyde Consultants (Woodward-Clyde) is submitting this report regarding the removal of two underground storage tanks at 14041 East Live Oaks Avenue, Irwindale, California (Figure 1). This report addresses the items listed in the Los Angeles County Department of Public Works closure report checklist (Attachment A). The two tanks consisted of a 10,000 gallon steel (unleaded) gasoline tank and a 10,000 gallon double-walled fiberglass diesel tank. Figure 2 shows the locations of the tanks.

The tanks were removed on April 23, 1991 in accordance with conditions specified in permit number 7963, file number 593. The general contractor for the removal was J. D. Edwards at 11711 Clark Street, Unit 110, Arcadia, California 91006. They employed the following additional subcontractors:

- Nieto & Sons Trucking, Inc., Brea, California
  (cleaned tanks and hauled and disposed of liquid waste)
- CTL Environmental Services, Harbor City, California
  (Certified Industrial Hygienist)
- Western Tank Testing, 22911 Savi Ranch Parkway, Yorba Linda, California (Degassed fuel tank)

Woodward-Clyde personnel documented the removal of the tank and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. During the tank removal activities, the air in and around the tank excavation was monitored for volatile organics with an organic vapor analyzer (OVA). Most of the readings were near background (1.5 ppm) with two exceptions. Two readings were taken when a gasoline odor was noticed that registered > 100 ppm. These readings were obtained prior to tank de-gassing and seemed to be due to wind blowing

the vapors from the tanks. The tanks were pumped, de-gassed and certified "clean" by a certified industrial hygienist, and were then transported to American Metal Recycling, Inc. 2202 South Milliken Avenue, Ontario, California for disposal. Documentation of the removal, certification, and proper disposal of the tanks is included in Attachment B.

Soil samples were collected beneath the ends of the tanks (at an approximate depth of 15 feet below grade) as specified in the removal permit. The samples were collected by using a backhoe to excavate soil from the desired depth, and then collecting a sample from the bucket of the backhoe, using a spatula. The samples were grab samples (no borings were drilled), and were collected within one half hour after the tanks were removed (between 2:15 and 2:45 pm). They were stored on ice and transported with chain-of-custody documentation to West Coast Analytical Services, Inc. for analysis for total petroleum hydrocarbons (TPH) and for volatile aromatic hydrocarbons by EPA Method 8020. The samples from beneath the gasoline tank were analyzed for TPH by EPA Method 8015 (modified), and the samples from beneath the diesel tank were analyzed for TPH by EPA Method 418.1. Laboratory reports and chain-of custody forms are included in Attachment C.

The analytical results revealed non-detect concentrations of TPH for all samples except for sample 1B, collected beneath the north end of the diesel tank, which contained 186 mg/kg of TPH. Low concentrations of toluene, ethylbenzene and xylenes were detected in three of the four samples. These compounds were also detected in similar concentrations in the lab blanks, indicating that their presence was due to laboratory contamination.

Given the detection of TPH beneath the north end of the diesel tank, Woodward-Clyde personnel collected additional samples to assess the magnitude and extent of the TPH. On May 3 1991, samples were collected at the same location as sample 1B, but at greater depths (20 and 25 feet) below grade. These samples were collected as described above, and were transported with accompanying chain-of-custody documentation to West Coast Analytical Service, Inc. for analysis for TPH by EPA Method 418.1, and for volatile aromatic hydrocarbons by EPA Method 8020. Both samples were non-detect for TPH. Low levels of toluene and xylenes were detected in the samples as well as in the lab blank, and 2 ug/kg of ethylbenzene was detected in sample T-20B.

On May 9 1991, four additional samples were collected. Samples 1B-N1, 1B-S1, 1B-W1 and 1B-E1 were collected 2 to 5 feet north, south, west and east, respectively, of the original sample 1B. These samples were collected as described above, and were transported with accompanying chain-of-custody documentation to West Coast Analytical Service for analysis for TPH by EPA Method 418.1, and for volatile aromatic hydrocarbons by EPA Method 8020. All of the samples were non-detect for the target compounds with the exception of sample 1B-W1 which contained 2 ug/kg of toluene.

The soil that was removed beneath the north end of the diesel tank for sample collection was stockpiled near the tank excavation. On May 15 1991, when the excavation was backfilled, this soil was transported to another location on the site in case further treatment was deemed necessary. This soil had no odor or discoloration.

CERTIFICATION

I have reviewed this report and declare that the information included herein is true and accurate and complete to the best of my knowledge.

CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 1460, Alhambra, CA 91802-1460, containing:

1. File number of facility and closure permit number.

2 Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.

3. Description of methods for obtaining, handling, and transporting samples.

4. Time and date samples were obtained.

5. If borings were established, boring logs certified by a CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

6. Chain-of-custody documentation initiated by person obtaining sample through person at State Department of Health Services certified laboratory.

7. Disposal destination of tanks and evidence of legal disposal.

8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

9. Documentation as to depth of groundwater at facility.

10. Manifests to document hazardous waste disposal of any removed soil and tank rinsate.

11. Any observations of site contamination.

12. Remedial action plan to mitigate contamination.

13. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

Certificate of Treatment/Recycling

ISSUED TO

United Conveyor Pipe

FOR

MANIFEST NUMBER 90321034 DATE RECEIVED 4-29-91

The aqueous waste received on the above manifest will be treated to standards mandated by the FEDERAL CLEAN WATER ACT and to effluent requirements established by the Sanitation Districts of Los Angeles County. Waste treatment and recycling is performed under permits granted to DeMENNO/KERDOON, a California corporation, by the California Department of Health Services, in coordination with the Environmental Protection Agency, in accordance with the provisions of the Resource Conservation and Recovery Act (RCRA) of 1976, together with applicable federal and state regulations including but not limited to waste discharge requirements established by the Sanitation Districts of Los Angeles County.

When the above described waste material is accepted by DeMENNO/KERDOON and treated/recycled and the aqueous phase discharged for further treatment by the Sanitation Districts, the certificate holder's responsibility for the waste material is eliminated under both RCRA and Proposition 65. Upon request, DeMENNO/KERDOON will issue this certificate that all waste material has been handled in accordance with applicable permits and the certificate holder's liability has been terminated.

DeMENNO/KERDOON

Project No. 904W217A

Los Angeles County Department of Public Works
900 South Fremont
Alhambra, California 91802

Atten: Waste Management Division

SUBJECT: TANK CLOSURE REPORT
FILE NUMBER 593, PERMIT NUMBER 7963

Dear Mr. Sjoberg,

On behalf of Mission-Koll I (Koll), Woodward-Clyde Consultants (Woodward-Clyde) is submitting this report regarding the removal of two underground storage tanks at 14041 East Live Oaks Avenue, Irwindale, California (Figure 1). This report addresses the items listed in the Los Angeles County Department of Public Works closure report checklist (Attachment A). The two tanks consisted of a 10,000 gallon steel (unleaded) gasoline tank and a 10,000 gallon double-walled fiberglass diesel tank. Figure 2 shows the locations of the tanks.

The tanks were removed on April 23, 1991 in accordance with conditions specified in permit number 7963, file number 593. The general contractor for the removal was J. D. Edwards at 11711 Clark Street, Unit 110, Arcadia, California 91006. They employed the following additional subcontractors:

- Nieto & Sons Trucking, Inc., Brea, California
  (cleaned tanks and hauled and disposed of liquid waste)
- CTL Environmental Services, Harbor City, California
  (Certified Industrial Hygienist)
- Western Tank Testing, 22911 Savi Ranch Parkway, Yorba Linda, California (Degassed fuel tank)

Woodward-Clyde personnel documented the removal of the tank and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. During the tank removal activities, the air in and around the tank excavation was monitored for volatile organics with an organic vapor analyzer (OVA). Most of the readings were near background (1.5 ppm) with two exceptions. Two readings were taken when a gasoline odor was noticed that registered > 100 ppm. These readings were obtained prior to tank de-gassing and seemed to be due to wind blowing

the vapors from the tanks. The tanks were pumped, de-gassed and certified "clean" by a certified industrial hygienist, and were then transported to American Metal Recycling, Inc. 2202 South Milliken Avenue, Ontario, California for disposal. Documentation of the removal, certification, and proper disposal of the tanks is included in Attachment B.

Soil samples were collected beneath the ends of the tanks (at an approximate depth of 15 feet below grade) as specified in the removal permit. The samples were collected by using a backhoe to excavate soil from the desired depth, and then collecting a sample from the bucket of the backhoe, using a spatula. The samples were grab samples (no borings were drilled), and were collected within one half hour after the tanks were removed (between 2:15 and 2:45 pm). They were stored on ice and transported with chain-of-custody documentation to West Coast Analytical Services, Inc. for analysis for total petroleum hydrocarbons (TPH) and for volatile aromatic hydrocarbons by EPA Method 8020. The samples from beneath the gasoline tank were analyzed for TPH by EPA Method 8015 (modified), and the samples from beneath the diesel tank were analyzed for TPH by EPA Method 418.1. Laboratory reports and chain-of custody forms are included in Attachment C.

The analytical results revealed non-detect concentrations of TPH for all samples except for sample 1B, collected beneath the north end of the diesel tank, which contained 186 mg/kg of TPH. Low concentrations of toluene, ethylbenzene and xylenes were detected in three of the four samples. These compounds were also detected in similar concentrations in the lab blanks, indicating that their presence was due to laboratory contamination.

Given the detection of TPH beneath the north end of the diesel tank, Woodward-Clyde personnel collected additional samples to assess the magnitude and extent of the TPH. On May 3 1991, samples were collected at the same location as sample 1B, but at greater depths (20 and 25 feet) below grade. These samples were collected as described above, and were transported with accompanying chain-of-custody documentation to West Coast Analytical Service, Inc. for analysis for TPH by EPA Method 418.1, and for volatile aromatic hydrocarbons by EPA Method 8020. Both samples were non-detect for TPH. Low levels of toluene and xylenes were detected in the samples as well as in the lab blank, and 2 ug/kg of ethylbenzene was detected in sample T-20B.

On May 9 1991, four additional samples were collected. Samples 1B-N1, 1B-S1, 1B-W1 and 1B-E1 were collected 2 to 5 feet north, south, west and east, respectively, of the original sample 1B. These samples were collected as described above, and were transported with accompanying chain-of-custody documentation to West Coast Analytical Service for analysis for TPH by EPA Method 418.1, and for volatile aromatic hydrocarbons by EPA Method 8020. All of the samples were non-detect for the target compounds with the exception of sample 1B-W1 which contained 2 ug/kg of toluene.

The soil that was removed beneath the north end of the diesel tank for sample collection was stockpiled near the tank excavation. On May 15 1991, when the excavation was backfilled, this soil was transported to another location on the site in case further treatment was deemed necessary. This soil had no odor or discoloration.

CERTIFICATION

I have reviewed this report and declare that the information included herein is true and accurate and complete to the best of my knowledge.

CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 1460, Alhambra, CA 91802-1460, containing:

1. File number of facility and closure permit number.

2 Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.

3. Description of methods for obtaining, handling, and transporting samples.

4. Time and date samples were obtained.

5. If borings were established, boring logs certified by a CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

6. Chain-of-custody documentation initiated by person obtaining sample through person at State Department of Health Services certified laboratory.

7. Disposal destination of tanks and evidence of legal disposal.

8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

9. Documentation as to depth of groundwater at facility.

10. Manifests to document hazardous waste disposal of any removed soil and tank rinsate.

11. Any observations of site contamination.

12. Remedial action plan to mitigate contamination.

13. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

Certificate of Treatment/Recycling

ISSUED TO

United Concrete Pipe

FOR

MANIFEST NUMBER 90321034 DATE RECEIVED 4-29-91

The aqueous waste received on the above manifest will be treated to standards mandated by the FEDERAL CLEAN WATER ACT and to effluent requirements established by the Sanitation Districts of Los Angeles County. Waste treatment and recycling is performed under permits granted to DeMENNO/KERDOON, a California corporation, by the California Department of Health Services, in coordination with the Environmental Protection Agency, in accordance with the provisions of the Resource Conservation and Recovery Act (RCRA) of 1976, together with applicable federal and state regulations including but not limited to waste discharge requirements established by the Sanitation Districts of Los Angeles County.

When the above described waste material is accepted by DeMENNO/KERDOON and treated/recycled and the aqueous phase discharged for further treatment by the Sanitation Districts, the certificate holder's responsibility for the waste material is eliminated under both RCRA and Proposition 65. Upon request, DeMENNO/KERDOON will issue this certificate that all waste material has been handled in accordance with applicable permits and the certificate holder's liability has been terminated.

DeMENNO/KERDOON

This Health and Safety Plan (HSP) presents health and safety requirements and guidelines for performance of work at the Project site in the city of Irvindale. California. It is in compliance with applicable sections of 29 CFR 1910.120 and was prepared for exclusive use by employees of URS Corporation and its subcontractors. This Health and Safety Plan (HSP) shall not be used for work other than that described herein; nor shall it be modified or used after the expiration date without written approval by the Project Manager (PM) and the Health and Safety manager (HSM). In addition. firms or persons not under contract to URS Corporation without shall not use this HSP written approval. This HSP is not valid unless it is signed and dated by the PM. the HSM. and the Regional HSO (RHSM).

Subcontractors may use their own HSPs if such a provision is contained in a written agreement with URS Corporation. General health and safety requirements prepared by subcontractors must be as stringent as those contained in this Health and Safety Plan.

The PM has overall responsibility for implementing this HSP. The Site Health and Safety Officer (SSO) reports to the PM. directs day-to-day health and safety activities in the field. and must be present at the work site whenever work is being performed at the site by employees of URS Corporation or its subcontractors. The HSM and RHSM are responsible for advising the PM and SSO on health and safety matters and monitoring compliance. The PM, SSO, HSM, and RHSM have the authority to suspend work when the health and safety of field personnel or the public is threatened and to remove individuals from the site for engaging in activities that jeopardize the health and/or safety of themselves or others.

This plan is for use in conjunction with URS Corporation's and each subcontractor's Health & Safety Manual or the Illness & Injury Prevention Program (IIPP) provisions for onsite employees.

This section discusses the responsibility for the Project Manager (PM), Health and Safety Manager (HSM), Site Safety Officer (SSO), Drilling Site Manager (DSM), and other site personnel. URS Corporation site personnel intend this plan for use only. Each contractor and subcontractor will be responsible for the safe and healthful performance of work by each of its employees and support personnel who may enter the exclusion zone.

2.1 PROJECT MANAGER (PM)

The PM has the responsibility of implementing this HSP. The PM needs to comply with applicable regulations and ensure that the operations and procedures proceed according to the Health and Safety Plan. The PM has the authority to suspend work when the health and safety of field personnel or the public is threatened. The PM and the HSM also have the authority to remove individuals from the site for engaging in activities that jeopardize the health and/or safety of themselves and/or others.

The Site Safety Officer (SSO) reports directly to the PM and keeps them abreast of the daily activities. The PM has overall responsibility for site health and safety. The SSO is responsible for assisting the PM in carrying out the health and safety requirements detailed in this plan.

2.2 REGIONAL HEALTH AND SAFETY MANAGER (RHSM)

The RHSM shall be responsible for the following:

- Direct the implementation of the Health and Safety Program of the operating group and provide recommendations for improvement of the program.
- Coordinate health and safety activities of the business unit offices in the operating group.
- Determine need for project Health and Safety Plans.
- Review and approve Health and Safety Plans.
- Direct changes in personnel work practices to improve health and safety of employees involved in hazardous waste management projects.
- Remove individuals from projects if their conduct jeopardizes their health and safety or that of co-workers.
- Suspend work on any project which jeopardizes the health and safety of personnel involved.

2.3 HEALTH AND SAFETY MANAGER (HSM)

The Health and Safety Manager (HSM) has responsibility for writing the Health and Safety Plan (HSP) and ensuring that all employees designated to work at the site in the exclusion zone, understand its content and application. The HSM ensures that all employees designated to work within the exclusion zone have participated in the 40 hour hazardous waste training course and have received medical clearance.

The HSM shall be responsible for the following:

- Advising the SSO and PM on health and safety matters as well as monitoring compliance. The HSM shall serve as a source of information on safety and occupational health for the SSO.
- Recommending methods of minimizing work site hazards to the degree necessary to create a safe and healthful work site.
- Investigating work-related injuries or illnesses and recommend corrective action.
- The HSM has the authority to suspend work when the work site contains hazards which threatens the health and/or safety of field personnel or the public. The HSM may also remove individuals from the site for engaging in activities that jeopardize themselves and/or others.

2.4 SITE SAFETY OFFICER (SSO)

The SSO will perform the following functions:

- Meet with the HSM prior to monitoring field activities to discuss the requirements of this HSP.
- Inspect equipment, machines, tools, the use of chemicals, substances or mixtures, work procedures, and work sites to identify potential hazards and maintain a documentation file of safety inspections.
- Provide technical assistance and conduct safety meetings to personnel working at the site on the safe and healthful use of chemicals, hazardous substances, and mixtures used at the work site.
- Maintain a field logbook which includes such items as working hours, names of people entering and leaving the site, instrument status, background readings, action levels reached or exceeded, and all other information relevant to health and safety at the site.
- Document and keep copies of initial and subsequent accident and injury reports for review and analysis by the Health and Safety Manager (HSM).
- Complete and return all information sheets to the HSM no later than one week after work activities at the site begin. This includes the Compliance Agreement Signature Sheet, the Acknowledgment Signature Sheet and the Safety Completion Form.

- Direct day-to-day health and safety activities in the field. The SSO must be present at the work site whenever work is being performed. The HSM is responsible for advising the PM and SSO on health and safety matters and monitoring compliance.
- Provide personal monitoring to URS Corporation personnel working at the site and environmental monitoring as needed.
- Implement the Health and Safety Plan (HSP) and enforce its guidelines.
- The SSO has the authority to advise the supervisor to halt an operation when work hazards are encountered. The SSO also has the authority to advise the dismissal of work site personnel that do not adhere to this plan.
- Maintain a list of addresses and telephone numbers of emergency assistance units (ambulance service, police, and hospitals), and will inform other members of the field team of the existence and location of this list.

2.5 DRILLING SITE MANAGER (DSM)

The supervisor for the drilling operations and procedures shall assume the role of Drilling Site Manager (DSM). The DSM retains overall site authority, except in the event of personnel exposure to contaminants. The DSM ensures safety meetings are conducted by the SSO, implement standard operating procedures for drilling operations and works with the SSO on site to implement this HSP. The DSM shall be responsible for the following:

- Inspect the work site with the SSO before work begins and periodically throughout the workday to identify predictable hazards and safeguards necessary for employee protection.
- Instruct employees on their responsibilities in the area of safety and occupational health.
- The DSM is responsible for implementing the Accident Prevention Program in their area of supervision and is also responsible for employee actions at work. Serious incidents or injuries must be reported to the SSO immediately.
- Give instructions on hazards and safety precautions to new employees when they are first employed. The DSM, or designated representative such as the SSO, must instruct employees in recognizing the hazards of the job and the methods and means to avoid injury and illness.
- The DSM shall not permit employees to work in an unsafe place unless for the purpose of making it safe and then only after proper precautions have been taken to protect employees while doing the work.
- Require employees to use safety devices and personal protective equipment when necessary.
- Allow only those employees qualified by training or experience to operate equipment, machines, vehicles or tools.
- Report safety deficiencies and hazards to management and the SSO.

There could be buried electrical and/or telephone transmission lines present at the site. The DSM shall contact Underground Service Alert at (800) 422-4133 three days prior to field work

commencing in order to locate all buried cables and utilities. The following information will be requested from Underground Storage Alert:

- County or city the operation will occur in;
- Address and cross-streets for each operation;
- Thomas Guide reference;
- Specific date and time the operation will begin;
- The foreman in charge of the operation;
- Permit number to break ground;
- Any special instructions;
- Type of work to be done;
- Who the work is being done for and by whom.

2.6 SITE PERSONNEL

Site personnel shall perform well development, drilling operations, work in or around the exclusion zone, and observe all applicable guidelines in this HSP. The site personnel shall be responsible for the following:

- Report work-related injuries or illnesses to their supervisors immediately, regardless of severity.
- Use personal protective equipment and safety devices which have been provided for use in performing work assignments, and replace or repair defective equipment items and parts.
- Report defective equipment immediately to the supervisor, such as a safeguard or safety device which is not operational or is missing.
- Report unsafe or dangerous conditions in the work site to the supervisor.
- Follow the HSP guidelines in addition to the supervisor's standard operating procedures for drilling operations.
- Conduct self in a professional and responsible manner while at the work site.

2.7 RESPONSIBLE INDIVIDUALS

Project Manager:	Jeff Reardon
Drilling Site Managers:	Mike Makerov
Site Safety Manager (SSM):	Mike Makerov
Health and Safety manager (HSM):	Ronald Miller
Regional Health and Safety Manager:	Ron Miller

Other authorized URS Corporation personnel for the former Hughes Market Facility Project site are:

- Taras Kruk
-

All other personnel that maintain current with the medical surveillance program and health and safety training requirements (40-hour, and 8-hour refresher qualified) are authorized for site work in the event that the aforementioned individuals are unavailable. Precision Sampling field personnel are the authorized subcontractor allowed on-site.

All personnel arriving or departing the site should log in and out with the SSO. All activities on site must be cleared through the PM.

Site personnel must obtain health and safety clearances before beginning work at the site. To obtain clearance, the individual must have: (1) been certified within the past 12 months by an occupational physician as being physically fit to wear respiratory protective devices and to work with hazardous chemical substances, (2) successfully completed a 40-hour basic health and safety training course, and (3) passed a respirator fit test with amyl nitrite and/or irritant smoke as indicators. Site managers and supervisors must have successfully completed an 8-hour manager's health and safety course in addition to all other clearance requirements.

URS Corporation subcontractor employees must also have similar medical, training, and respirator fit clearances and may be required to provide proof of clearance before beginning work.

The names of all URS Corporation employees that perform work at the site must be recorded and the records will be maintained in the health and safety file of the project administration office.

The SSO or the PM will provide a copy of the Compliance Agreement to the HSM within 1 week of the initiation of field tasks.

All personnel who enter the exclusion zone must be trained to understand the potential health and safety hazards associated with their tasks. In accordance with OSHA 29 CFR 1910.120, all personnel will have received a minimum of 40 hours of initial instruction prior to entering the exclusion zone, and minimum of 3 days of field experience under the direct supervision of a competent person.

3.1 SAFETY BRIEFING

Before on-site work commences, all URS Corporation employees and subcontractor employees assigned to work in the exclusion zone must be briefed by the SSO or the HSM on the site-specific health and safety requirements contained in this plan. The health and safety officer giving the briefing should test the workers knowledge and understanding of the provision of this HSP and shall not allow anyone who does not appear to understand the provisions perform work in exclusion areas. The dates of briefing sessions and attendees must be recorded and the records maintained in the health and safety file of the project administration office. Area safety orientation/training meetings must be convened: 1) before the field work begins on a weekly basis, 2) when there are modifications to the Health and Safety Plan that are applicable to field personnel or 3) when additional personnel begin field work. Those workers involved in carrying out the project and who will be affected by changes being implemented will attend the meetings. The meeting agenda should include the following items as appropriate:

- A review of the plan.
- Verification of medical and safety training.

- Distribution of modifications to the plan.
- Signatures of all in attendance, acknowledging receipt and understanding of the plan and the compliance agreement.

The Compliance Agreement will be signed on the first day of field work prior to start-up. **The SSO or the PM will provide a copy of the Compliance Agreement to the HSO within 1 week of the initial of field tasks.** The Compliance Agreement and all other Health and Safety Forms are provided in Appendix A. Safety meetings should be held every morning thereafter to discuss possible safety hazards for field operations.

3.2 DISTRIBUTION OF THE HEALTH AND SAFETY PLAN

A copy of this HSP must be provided to each employee assigned to work at the site, as well as to an authorized representative of each firm contracted by URS Corporation to perform work on site, before any work begins. Individuals assigned to work at the site must acknowledge receipt of the plan and agree to comply with its provisions in writing.

The following records will be maintained on-site by the SSO, and copies will be sent to the HSM:

- A list of personnel qualified to work, according to the compliance statement.
- A signature sign-in sheet of all personnel entering and exiting the exclusion zone.
- This Health and Safety Plan with compliance agreements.
- Copies of Hazardous Waste Operation Training Certificates.
- Copies of medical clearance letters and all other medical monitoring performed such as heat stress monitoring.
- Exposure monitoring data from the direct reading instruments.

This HSP will remain on-site. All personnel at the site will know its location and it will be available for inspection at any time.

3.3 INCIDENT REPORTING

Injuries, exposures, illnesses, safety infractions, and other incidences specified in this Health and Safety Manual must be reported to the HSM within 24 hours of occurrence, or immediately if a hospitalization or fatality is involved. In the event of an accident/incident an Incident Investigation form will be completed and provided to the HSM within 2 working days.

An incident is any event listed below:

- Illness resulting from chemical exposure or unknown causes.

- Physical injury, including those that do not require medical attention.
- Fire, explosions, and flashes resulting from activities performed by URS Corporation and/or their subcontractors.
- Property damage resulting from activities performed by URS Corporation and/or their subcontractors.
- Vehicular accidents occurring on-site or while traveling to and from sites.
- Infractions of safety rules and requirements.
- Unexpected chemical exposures (indicated by irritation of eyes, nose, throat or skin).

Work will be suspended to correct the cause of the accident/incident and to modify this plan as necessary.

3.4 SAFETY COMPLETION REPORT

Upon completion of the work covered by this plan, a Safety Completion Report must be submitted to the HSO within 5 working days. The report should include a critical evaluation of this HSP and all approved notifications, names, and affiliations of individuals who worked at the site, exposure monitoring data with monitoring dates and decisions made, summary of incidences and action taken, if any, and recommendations for improving health and safety at similar sites.

3.5 VISITOR CLEARANCES

Visitors will not be allowed within 25 feet of intrusive work, unless they comply with the safety requirements of this plan. Barrier tape will be used to delineate the exclusion zone where visitors are not allowed to enter.

3.6 POSTING REQUIREMENTS

The following information shall be posted or readily available on site:

- Public notification.
- OSHA poster.
- Proposition 65 notification.
- Emergency phone numbers.
- Directions to the nearest hospital.
- URS Corporation's Health and Safety Manual including the Illness and Injury Prevention Program.
- This Site Safety Plan.

4.1 SITE DESCRIPTION

The former Hughes Market facility is located at 14041 East Live Oak Avenue in Irvindale, California. The site was formerly part of a larger 74-acre parcel (14041 east Live Oak Avenue) that was owned and occupied by united Concrete Pipe (UCP). Ralph's Market acquired Hughes Markets and the property is now considered excess and is in the process of being sold.

The property is located east of the San Gabriel River Channel and south of the Santa Fe Dam. Rivergrade Road borders the subject property to the north northwest, to the northeast by Arrow Highway, a vacant lot to the east and south by Live Oak Avenue. The property is developed with a 2-story vacant office building, asphalt, asphalt parking lots, concrete sidewalks, and landscaped with grass, shrubs, and trees.

4.2 SCOPE OF WORK

The following scope of work will be performed at the former Hughes Market facility:

- Conduct site geophysical survey to verify utilities clearance before beginning the intrusive investigation.
- Supervise removal and re-construction of interior room walls by licensed contractor in order to provide access for drilling operations. Saw cut the concrete floor of the building were the drilling locations would be located.
- Advance five soil borings to 40 bgs in the locations of the former gasoline dispenser island and USTs to collect soil samples at 5-foot intervals for analytical testing.
- Backfill the borings with Hydrated Bentonite chips to 6" from surface then capped with concrete patch.

The exposure limits of the primary chemicals of concern are as follows:

	PEL/TLV (ppm)	STEL (ppm)
Carbon Monoxide	25	400
Ethylbenzene	100	100
Benzene *	1	5
Toluene	50	150
Methyl-tertiary-butyl ether (MTBE)		
Xylene	100	100
Petroleum Hydrocarbons†	300	500

Note: * Chemicals known to the State of California to cause cancer or reproductive harm

† Petroleum Hydrocarbons PEL and STEL as gasoline.

Permissible Exposure Levels (PELs) are CAL-OSHA permissible exposure limits for airborne concentrations of toxic substances measured as an 8-hour time weighted-average (TWA). The CAL-OSHA PEL's are the recognized levels to which the monitoring at the site will adhere to. Short Term Exposure Levels (STELs) are CAL-OSHA short-term exposure limits measured as a 15-minute TWA. CAL-OSHA requires that controls be implemented when employee exposure exceeds these limits. If contaminant levels listed in the table above exceed the project action levels, control measures, such as intrinsically safe fans or respirators, will be implemented.

Due to the chemicals suspected of being on-site, URS Corporation has established action levels of 5, 25 and 100 ppm.

If a reading of 5 ppm above background registers on the OVA in the breathing zone (2 to 5 feet from the ground surface), the breathing zone will be analyzed for Benzene with Draeger Tubes. Continue monitoring with Draeger Tubes. If a reading of 25 ppm registers on the OVA, employees will upgrade to full-face respirators with organic/HEPA filter cartridges. If the Benzene concentration is 10 ppm, workers will upgrade to Level B. If a reading of 25 ppm registers on the CGI for CO, workers will upgrade to Level B. If a reading of 100 ppm is obtained on the OVA or 500 on the CGI for CO, work will be stop work, the area will be evacuated, and the HSO will be informed immediately.

5.1 CARBON MONOXIDE (CO)

Carbon monoxide is a colorless, odorless gas. Carbon monoxide can affect the body if it is inhaled or if liquid carbon monoxide comes in contact with the eyes or skin. Exposure to carbon monoxide decreases the ability of the blood to carry oxygen to the tissues. Inhalation of carbon monoxide may cause headache, nausea, dizziness, weakness, rapid breathing, unconsciousness, and death. High concentrations may be rapidly fatal without producing significant warning symptoms. Exposure to this gas may aggravate heart disease and artery disease and may cause chest pain in those with pre-existing heart conditions. Pregnant women are more susceptible to the effects of carbon monoxide exposure. The effects are also more severe in people who are working hard and in people who are working in places where the temperature is high or at altitudes above 2,000 feet. Skin exposure to liquid carbon monoxide may cause frostbite-type burns.

CO gas causes tissue hypoxia by preventing the blood from carrying sufficient oxygen. With exposure to high concentrations such as 4,000 ppm and above, transient weakness and dizziness may be the only premonitory warnings before coma supervenes. The most common early sign of severe exposure is cerebral edema. Exposure to concentrations of 500 to 1,000 ppm causes the development of headaches, tachypnea (rapid breathing), nausea, weakness, dizziness, mental confusion, and in some instances, hallucinations, which may result in brain damage.

5.2 BENZENE

Benzene is a clear, volatile, colorless, highly flammable liquid with a characteristic aromatic odor. Benzene is a constituent of motor oils and is used as a solvent. It is a human carcinogen with evidence indicating it causes leukemia. Acute exposure may cause central nervous system (CNS) depression. Symptoms may include headaches, dizziness, nausea, convulsions, coma and even death. The Federal and Cal-OSHA standard for benzene is 1 ppm with a 5 ppm short-term exposure limit (STEL). The American Conference of Governmental Industrial Hygienists (ACGIH) recommends a Threshold Limit Value (TLV) of 10 ppm. The Immediately Dangerous to Life and Health (IDLH) level is 500 ppm. The odor threshold for benzene in air is 12 ppm and in water is 0.17 ppm. Route of exposure is usually inhalation, and the symptoms are dizziness, vomiting, nausea, aplastic anemia and ventricular fibrillation.

5.3 ETHYLBENZENE

Ethyl benzene is a colorless, flammable liquid with an aromatic odor. This compound is employed as a solvent and as an intermediate in the production of styrene. Ethyl benzene is also found in automotive or aviation gasoline. Significant amounts of ethyl benzene are also found in mixed xylenes which are used as diluents for paint.

Ethyl benzene toxicity is characterized by its irritancy to the skin, and less markedly, to the mucous membranes. Ethyl benzene is the most sever skin irritant of the benzene series. Symptoms resulting from exposure may include irritation of the eyes, headaches, dermatitis, narcosis and coma.

At 1,000 ppm, ethyl benzene causes distinctive eye irritation and tearing, but tolerance develops rapidly; and at 200 ppm, the vapor has a transient irritant effect on human eyes. No systemic effects are expected at levels producing distinctively disagreeable skin and eye irritation.

Ethyl benzene is incompatible with strong oxidizers and can be a dangerous fire hazard. It has a lower explosive limit of 1.0 percent and an upper explosive limit of 6.7 percent. The odor threshold for ethyl benzene in air is 2.3 ppm and in water is 0.029 ppm.

5.4 TOLUENE

Toluene (toluol, methyl benzene) is used as constituent in the formulation of automotive and aviation fuels. Toluene is a colorless liquid with an aromatic odor. It is flammable by standard tests in air and is not soluble in water. The major response to toluene at high concentrations is depression of the central nervous system. Olfactory fatigue occurs rapidly upon exposure. Eye irritation occurs around 300 to 400 ppm. The lower explosive limit is 1.3 percent and the upper limit is 7.1 percent. The ACGIH recommended TLV for an 8-hour exposure is 50 ppm.

5.5 XYLENE

Xylene is a clear flammable liquid with an aromatic odor. Commercial xylene is a mixture of the isomers; ortho-, meta- and para- xylene. Xylene mixtures may also contain ethyl benzene and toluene. Xylene is a solvent and a constituent of paint, lacquers, varnishes, cleaning fluids and aviation fuels.

Xylene vapors may cause irritation of the eyes, nose and throat. Skin contact may cause dermatitis. When inhaled at high concentrations the initial signs of exposure may include a flushing or reddening of the face and a feeling of increased body heat, owing to the dilation of the superficial blood vessels. In addition, there may be blurred vision, dizziness, tremors, staggering, drowsiness, salivation, cardiac stress, CNS depression, unconsciousness and eventually coma. Extremely high concentrations may cause pulmonary edema, anorexia, nausea, vomiting and abdominal pain. Pulmonary retention of xylene vapors in human subjects amounts to about 64 percent of the inhaled dose, xylene may also be absorbed through the skin and does not appear to be influenced by the application of barrier creams. Xylene is metabolized to methylhippuric acid which is excreted in the urine and can be used as a biologic indicator of exposure.

Xylene is incompatible with strong oxidizers and can be a dangerous fire hazard. It has a lower explosive limit of 1.1 percent and an upper limit of 7 percent. The odor threshold for xylene in air is about 1 ppm. The odor threshold for meta-xylene in air is 1.1 ppm and in water is 0.017 ppm.

5.6 PETROLEUM HYDROCARBONS

Petroleum hydrocarbons are not expected to be acutely toxic, but can be irritating to the skin. In general, some fuel oils have flash points of 100 degrees Fahrenheit, with auto-ignition temperatures of 494 degrees Fahrenheit. They are considered to be a moderate fire hazard when exposed to heat, flame or oxidizers. Many petroleum products are proven skin carcinogens in animals and could lead to the development of similar lesions in humans if allowed to remain on the skin for an extended period of time. Obviously, prolonged skin contact should be avoided.

Many of the industrially important aliphatic saturated hydrocarbons are found in earth gas or crude oil. Some family members are used and others are formed during combustion of fuels, by catalytic cracking, or in other specialized petrochemical processes. Paraffin mixtures are used extensively as fuels, refrigerants, propellants, pesticides, lubricants, solvents for paints, protective coatings, plastics, degreasing operations, and in purified form as food additives. The toxicity characteristics of the alkanes are minimal for the gases and solids, but are moderate for the liquid materials.

Cycloparaffins, also named cycloalkanes, belong to this chemical category. Cyclanes are extensively used to produce reformed aromatics. Some are utilized as inhalation anesthetics, and are synthesized in pure form by the reduction of dihalogenated propane precursors. The lower cycloparaffins are gases and have been used as anesthetics, especially cyclopropane. The higher members are liquids with narcotic properties. From C6 on, the margin between narcosis and death is very narrow and symptomatically barely recognizable. The alicyclics, in general, are CNS depressants with low acute and chronic toxicities. This is due to their rapid excretion in unchanged form or prompt conversion into water-soluble metabolites. Inhalation by humans at high concentrations may cause excitement, loss of equilibrium, stupor, and coma. Cycloparaffins are dermal irritants; they defat the skin to cause morphological changes and hypothermia.

5.7 METHYL-T-BUTYL ETHER (MTBE)

MTBE is among the top 50 chemicals produced in the United States. The primary use is as a gasoline additive to boost octane and improve combustion efficacy by "oxygenation." It is present in about 10 percent of the United States gasoline supply, primarily in unleaded premium brands. This percentage is expected to increase as leaded gasoline is phased out.

Ingestion of gasoline-MTBE mixtures may result in aspiration pneumonitis. Inhalatión of MTBE produces anesthesia in animals. Dizziness or suffocation may result following inhalation exposure. Contact with MTBE may irritate or burn skin and eyes. Although MTBE has been shown to be metabolized to methanol and formic acid in animal models. methanol or formic acid has only been detected in trace quantities in humans treated with MTBE for gallstone dissolution. MTBE is a mild eye irritant but otherwise is not very toxic in acute exposures. The effects of chronic exposure to MTBE are not well understood. The ACGIH recommended TLV for an 8-hour exposure is 40 ppm.

All subcontractors and operators are responsible for ensuring that their respective employees comply with all Federal, State, and/or local health and safety standards, laws, and rules. The SSO for URS Corporation will assist in these matters, but it is the responsibility of the subcontractors to ensure compliance.

6.1 DRILLING

URS Corporation will monitor the drilling activities and collect soil samples. Two 10-foot and two 15-foot borings will be drilled at the site. The primary hazards associated with drilling are listed below. The SSO will assess the hazards in the work zone and implement the appropriate procedures before work commences.

HAZARD	PRECAUTION
Chemical Exposure	Site Health and Safety Officer will monitor the breathing zone with an OVA and a Carbon Monoxide monitor
Physical Injury	Hard hats, safety glasses, and steel-toed boots will be worn at all times in the work zone. Good housekeeping and caution around the drill rig will be required
Underground or Aboveground Utilities and Structures	Underground Service Alert will be notified before subsurface intrusion occurs. Personnel will avoid work near overhead obstructions
Noise	Hearing protection shall be worn when noise levels are 85 decibels or greater

Refer to Standard Operating Procedure in the URS Corporation Health and Safety Manual and Appendix B for safety procedures during drilling operations.

Only trained operators are allowed to operate drilling equipment. All underground utilities must be located and cleared prior to drilling. Loose clothing should not be worn near moving machinery, augers, or other drilling equipment. Long hair should be tucked under hard hats or tied back.

Prior to raising or lowering the mast, the drilling must be sure that all persons are in sight. Ensure that the masts maintain at least a 10-foot clearance of electrical transmission lines at ALL times. In the event of an electrical storm, stop all drilling operations.

Drillers, tool pushers, supervisors, and persons in direct charge of crews in field operations should have a current certificate of first-aid training. There should be at least one employee with current certification.

6.1.1 Protective Measures for Drilling Operations

During drilling operations personnel within the work zone (25 feet) must wear steel-toed safety boots, Tyvek coveralls, hard hat, and safety goggles or glasses. The SSO must be present during drilling activities and will monitor the work area with the organic vapor analyzer (OVA). If readings exceed 100 ppm the area must be evacuated until vapor levels dissipate, or workers will upgrade to level B PPE, and the HSM must be notified. If unknown liquids are encountered, drilling must be halted.

The physical hazards associated with the project include fire, explosion, noise, heavy equipment operation, falling, tripping or contact with utility distribution lines.

7.1 NOISE

Working near drilling equipment or around heavy equipment can subject workers to excessive levels of noise. Ideally, personnel who do not need to be next to noisy equipment should stay as far away as possible to lower their risk to noise-induced hearing loss. Site personnel who must work next to this equipment will wear hearing protection such as ear plugs or muffs to reduce their exposure. Periodic noise monitoring may be conducted with the use of a sound level meter or a sound dosimeter. Equipment operators should be advised to wear hearing protection.

7.2 HEAVY EQUIPMENT

The rotating shafts associated with the drilling equipment compressors and moving parts of heavy equipment create pinch points which can cause serious injury. In all cases, rotating shafts or gears should be covered to prevent accidental contact. In some cases, where rotating parts cannot be adequately guarded, only experienced operators should be allowed to work around these rotating parts. Personnel who must work around rotating equipment should not wear loose fitting clothes that could become easily caught. Personnel operating the heavy equipment must be trained. Personnel should take extra precautions when working indoors or tight spaces with heavy equipment (i.e., bobcats) because of limited escape distance.

The primary hazard around heavy equipment is the lack of visual contact with equipment operators. Employees should be very cautious around heavy equipment, making sure that they have been seen by all operators when they are in, or around the work area. Site personnel will be required to wear high visibility orange construction vests while on site.

7.3 FALLING AND TRIPPING

The ground around the work area may become uneven over time and may be cluttered with pieces of equipment. These situations can result in workers falling or tripping and subsequently injuring themselves. To reduce this risk, the SSO will report trip hazards to the Drilling Site Manager, and have them immediately taken care of.

7.4 HEAT STRESS

Due to the Southern California climate, heat stress could be of some concern. Bottled water will be available at the decontamination areas so that site personnel can conveniently consume fluids. A modified decontamination procedure will be in effect so that workers will not have to completely remove all contaminated garments prior to consuming water. Heat stress can result when protective clothing decreases natural body ventilation. If temperatures on-site exceed 75o F while protective coveralls are being worn, then heat stress monitoring should be employed. Monitoring would include watching the workers for visible signs of heat stress and taking the heart rate of workers. The heart rate should be taken twice daily and the results should be recorded. If no temperatures are elevated at the end of the first week of activity, temperature monitoring frequency may be decreased at the discretion of the Site Safety Officer.

7.5 ELECTRICAL SAFETY AND LOCKOUT/TAGOUT

URS Corporation's procedure for electrical safety, and Lockout/tagout, will be followed for work potentially near electrical sources underground, in building walls, ceilings and slabs. Proper electrical connections, ladders, extension cords etc. will be used when power is needed. Caution will be taken around water and to prevent electrical cords from becoming a trip hazard. With site work or work on the portable remediation system, energizing sources will be properly deenergized before being serviced by employees.

7.6 BURIED UTILITIES

There may be a number of buried electrical and telephone transmission lines at the site. The underground utility locations should be found prior to drilling operations. The boring locations will be shifted if necessary to avoid the underground obstructions. Site drawings should be reviewed prior to breaking any ground.

7.7 FIRE/EXPLOSION

Explosive levels of gases and vapors are not anticipated. However, an action level of 10 percent of the LEL will be used for stopping work operations. In addition, extra precautions for sparks, flammable materials and electricity must be taken because the fire protection system of the facility will be compromised. Fire extinguishes. (2 minimum) must be posted at exits from the building or work location.

7.8 CONFINED SPACE ENTRY

Confined space entry will not be performed on this project and requires the approval of the HSM if needed.

7.9 VENTILATION

Exhaust from combustion engines used indoors must be exhausted to the outside by extension hoses. blower motors and/or building ventilation to reduce/remove CO exhaust from the building or near by work areas. Other contaminant must be controlled to the maximum degree possible (i.e., soil wetting. plastic barriers or vapor suppression) to minimize the need for respiratory protection.

Access to hazardous and potentially hazardous areas or spill sites must be controlled to reduce the probability of occurrence of physical injury and chemical exposure of field personnel, visitors and the public. A hazardous or potentially hazardous area includes any area where (1) field personnel are required to wear respirators, (2) borings are being drilled with a drilling rig, or (3) excavating operations with heavy equipment are being performed.

Limited access zones or exclusion zones are the most highly contaminated portions of the site. The outer boundary of the exclusion zone will be established according to the location of potentially hazardous substances, drainage, leachate, spilled material and visible discolorations. The perimeter must be clearly marked by physical barriers. Access control is established at the periphery of the exclusion zone to regulate the flow of personnel and equipment into and out of the zone and to verify implementation of proper entering and exiting procedures. No one will be allowed into the exclusion zone without the appropriate protective equipment and required training. No one will be allowed into the zone once intrusive work commences.

Cordons, barricades, or emergency traffic cones or posts, depending on the conditions must identify the boundaries of hazardous and potentially hazardous areas. If such areas are left unattended, signs warning of the danger and forbidding entry must be placed around the perimeter of the site. This is especially important if the work areas are accessible to the public. Trenches and other large holes must be guarded with wooden or metal barricades spaced no further than 20 feet apart and connected with yellow or yellow and black nylon tape not less than 3/4-inch wide. The barricades must be placed no less than two feet from the edge of the excavation or hole.

Entry of hazardous areas shall be limited to individuals who must work in those areas. Unofficial visitors must not be permitted to enter hazardous areas while work in those areas is in progress. Official visitors should be discouraged from entering hazardous areas, but may be allowed to enter only if they agree to abide by the provisions of this document, follow orders issued by the SSO, and are informed of the potential dangers that could be encountered in the areas.

Personal protective equipment is a means of isolating a worker from a potential exposure to a contaminant source. Physically isolating the sources from the surrounding work environment is generally not possible on hazardous waste sites, thus the worker must be isolated from the work area. Use of personal protective equipment places a high degree of responsibility for safety on the field worker. Exposure can occur during lapses in standard operating procedures, failure of protective equipment, removal of protective equipment at the end of work periods, or use of improper or damaged equipment. However, a properly administered personal protective equipment program can offer an effective means of control or act as a supplement or backup to controls at the source of the hazards. Employees at the job site will be trained on the selection and use of personal protective equipment as well as proper maintenance, storage, decontamination, disposal, inspection, donning and doffing procedures.

The following equipment listed below will be available on-site for use when needed:

- Dark blue Tyvek coveralls must be worn when working within the exclusion zone.
- Safety goggles or glasses must be worn when working within 25 feet of operating equipment (e.g., drill rig, pressure washers, etc.). The goggles must be splash proof for handling concentrated fuel products.
- Safety boots, calf-length, with steel toe, must be worn when working within 25 feet of operating equipment.
- Hard hat must be worn when working within 25 feet of operating equipment.
- Earplugs will be at the site and should be worn by any individual working within close proximity of heavy equipment.
- First Aid Kit will be available at the site to assist with small-scale injuries.
- Fire extinguishers will be available at the site and placed in a readily accessible location.
- Barricades will be established to designate decontamination and exclusion zone areas.
- NIOSH-approved full-face respirators with organic vapor and high efficiency dust cartridges. Respirators must be worn when the total airborne hydrocarbon action level of 10 ppm is reached or exceeded.
- Airline or self-contained breathing apparatus. This must be worn when the total airborne CO action level of 25 ppm is reached or exceeded.
- Nitrile or neoprene gloves with latex gloves underneath. The two layers of gloves must be worn when handling contaminated soil or water. They must be worn during sampling procedures.
- Highly visible construction vests will be worn while on-site.
- Saranex or polyethylene coated Tyvek coveralls when working in dry or wet conditions with well development operations.

TABLE 9-1

PPE LEVELS

USEPA PPE Level	Required PPE
D	- Disposable coveralls, cotton coveralls, or work clothes - Safety glasses with side shields - Steel-toed shoes - Hard hat (where overhead hazards exist). - Ear protection (in high noise areas)
Modified Level D	- Tyvek ®(or equivalent) coveralls - Safety glasses with side shields - Chemical protective gloves - Steel-toed shoes with disposable shoe covers or chemical protective steel-toed boots - Hard hat (where overhead hazards exist). - Ear protection (in high noise areas)
C	- Tyvek ®(or equivalent) coveralls - Inner Nitrile gloves - Outer Nitrile gloves - Steel-toed shoes - Disposable shoe covers - Hard hat (where overhead hazards exist). - Full-face respirator with combination dust and organic vapor cartridges. - Ear protection (in high noise areas)
B	- Saranex ®(or equivalent) outer coveralls - Tyvek ®(or equivalent) inner coveralls - Inner Nitrile gloves - Outer Nitrile gloves - Steel-toed shoes - Disposable shoe covers - Hard hat (where overhead hazards exist). - Airline or self contained breathing apparatus - Ear protection (in high noise areas)

9.1 DIRECT READING EQUIPMENT

The following direct reading instruments will be on site:

- Combustible Gas Indicator (CGI - 4-way gas meter) - a CGI with LEL and 0 to 500 ppm scales is the preferred instrument to measure explosive levels and CO at the site. The explosivity action level is 20 percent of the LEL for hexane calibrated CGI's and 47 percent of the LEL for methane calibrated CGI's. The PEL for CO is 25 ppm.
- Organic Vapor Analyzer (OVA) - is the preferred instrument for monitoring total organic vapor concentrations at the site during drilling operations. At each monitoring location, the ambient background reading (15-minute average) will be measured upwind of the work zone.
- Draeger Tubes - to ascertain the type of chemical contamination present at the site.

Vapor monitoring should be performed as often as necessary and wherever necessary to protect field personnel from hazardous vapors. Individuals trained in the use and care of the required instruments must perform monitoring. Due to the fact that toxicity levels are considerably lower then explosivity action levels, monitoring efforts should focus initially on detection of toxic vapors. The presence of explosive levels of gases and vapors should be performed only when gas/vapor concentrations exceed the ppm range of the monitoring instruments and when explosive levels are expected (e.g., inside tanks and other enclosed spaces).

During drilling operations, vapor emissions should be measured continuously. The sample intake orifice or the detector must be positioned in a safe place downwind of the borehole and the instrument alarm should be set to sound at the action level. If the alarm sounds while monitoring continuously for toxic concentrations, the sample intake orifice or detector should be moved so that vapor concentrations in the breathing zone of individuals closest to the boring are measured. Decisions regarding respirator use should be based on breathing zone vapor concentrations. If the alarm sounds while continuously monitoring fire explosive concentrations, initiate shut-down and evacuation procedures immediately.

Draeger Tubes will be available for detecting selected contaminants and will be used periodically during activities within the contaminated zones. If the OVA indicate elevated readings, greater than 5 ppm., detector tubes will then be used to more specifically characterize the airborne contaminants. Polytest, methyl bromide, and ethyl acetate tubes will be used in the decision process.

Detector tubes will be utilized for substances which my be encountered. The typical variation of detector tubes varies from 10 to 30 percent, depending on the compounds of concern and the concentration ranges measured. Detector tubes are designed for concentration levels at or around the

Threshold Limit Value (TLV) for each respective substance. A Draeger tube decision tree that will be used is attached.

If at any time an unknown contaminant level of 5 ppm is reached the job will be shut down. A trained worker in a self-contained breathing apparatus (SCBA) will enter the work area and perform the Draeger tube tests.

Decontamination of equipment and personnel is necessary to confine the contaminants to the exclusion zone, if contaminated soils are found at the subject site. Prior to leaving the exclusion zone, all major equipment, tools and materials will be cleaned to remove grease, oil, or encrusted dirt. The Contractor will provide the necessary components for personnel and equipment decontamination.

A decontamination station and procedure will be established by the SSO during site mobilization. The decontamination station will be designated within the contamination zone and will be located upwind of the exclusion zone. The procedure will consist of a liquid soap and water wash for hands, face, and hard hats. Prior to eating or drinking, personnel will wash their hands and faces with soap and water. A general sequence of doffing procedures is outlined below:

- Wash work gloves and boots.
- Remove coveralls.
- Rinse respirator.
- Wash hands and face.

Trichloroethene and perchloroethene should be removed from skin using a mild detergent and water. Hot water is more effective than cold water and liquid dishwashing detergent is more effective than hand soap.

An effective decontamination area can be established by spreading a water-proof ground sheet and using several large 30 gallon tubs for personal decontamination. The decontamination area will be established by the SSO in discussion with the PM. The criteria used in selecting a site will be:

- Ease of containment of contaminated materials.
- Access to water.
- Accessibility to on-site personnel.

The area will be cordoned off in a similar manner to the exclusion zone. The following areas of decontamination will be identified and removal of the indicated protective equipment in the specified order will be completed in this area.

10.1 STATION ONE - EQUIPMENT DROP

Personnel will place tools, devices, containers, instruments, radios, and clipboards onto plastic sheets. These plastic sheets will be decontaminated and stored in plastic bags later.

10.2 STATION TWO - WASH AND RINSE

Personnel will step into a plastic tub of liquid soap and water washing solution. Personnel and their partners will scrub each others' Tyvek coveralls, gloves, and boots using long handled brushes. The personnel will then step into a plastic tub of rinse water and rinse the Tyvek coveralls, boots and gloves thoroughly. Personnel will then step out of the tub and dry-off. Boots and gloves remain on.

10.3 STATION THREE - REMOVAL

The protective equipment will be removed in the following order:

- Tape from boots and gloves
- Outer glove
- Remove boots if there are feet in the Tyvek
- Remove the Tyvek before the boots if there are no feet in them
- Remove the inner glove.

10.4 EQUIPMENT DECONTAMINATION

All major reusable equipment and other tools used for work will be decontaminated prior to leaving the exclusion zone. Cleaning will normally consist of scrubbing to remove encrusted materials, followed by a soap and water wash and potable water rinse. Containers of detergent solutions for cleaning tools, boots, and gloves will be available in the exclusion zone. Decontamination of equipment will be performed at a designated area within the contamination zone.

Sampling equipment, augers, vehicle undercarriages and tires should be steam cleaned. The steam cleaner is also a convenient source of hot water for personnel and protective equipment cleaning.

Response Levels I require the use of direct reading instruments. Response Levels II and III will require the use of respiratory protection and Response Level IV may require excavation of field personnel from the work zone by the Site Safety Officer. Each of the response levels and associated actions are described below.

11.1 RESPONSE LEVEL I

If an OVA reading of 5 ppm or greater is observed in the breathing zone, the field actions that will be performed at Response Level I to protect site personnel are:

- If Benzene is detected with Draeger tubes, workers will upgrade to full face respirators (Level C). The Draeger tube decision tree is attached in Appendix C.
- If no Benzene is detected, the SSO will continue to monitor for benzene and other hydrocarbons immediately near the drilling area and exclusion zone perimeter.

11.2 RESPONSE LEVEL II

If an OVA reading of 25 ppm or greater is observed in the breathing zone, the field actions that will be performed at Response Level II to protect site personnel are:

- Workers within the zone will upgrade to full face respirators (Level C) when 25 ppm total organic is detected on the OVA
- The SSO will continue to monitor immediate drilling area and exclusion zone perimeter.
- Suspend all work in the immediate area if the contaminant is benzene.

11.3 RESPONSE LEVEL III

Response Level III is triggered by exceeding 25 ppm on the CGI for CO in the work area. Level III requires the SSO to take the following field actions.

- All workers will upgrade to Level B
- The SSO will continue to monitor immediate drilling area and exclusion zone perimeter.

11.4 RESPONSE LEVEL IV

Response Level IV is triggered by exceeding 100 ppm total organic on the OVA or 500 ppm CO on the CGI in the work area. Level IV requires the SSO to take the following field actions.

- Suspend all work in the immediate area.

- Take actions to suppress emissions with appropriate protective equipment (water, plastic, etc.).
- Continue monitoring within and at the downwind boundary of the contaminated zone.
- Resume work only when clearance has been obtained from the SSO.
- Initiate the notification process.

11.5 EMERGENCY NOTIFICATION LIST

The SSO will be trained to render basic first aid. Every injury will be reported and entered in the field log. In the event of fire, explosion, accident or injury, the SSO or other site personnel will contract the appropriate emergency response group. The emergency telephone numbers listed below are for obtaining emergency services at the URS Corporation Project site.

1.	URS Corporation Manager	Work - (714) 835-6886 Beeper - (714) 201-0049 Contact: Jeff Reardon
2.	URS Corporation Health and Safety Manager	Work - (714) 835-6886 Beeper - (800) 970-8131 Contact: Ron Miller
3.	Fire Emergency	911
4.	Rescue Emergency	911
5.	Poison Control	(800) 662-9886
6.	HOSPITALS	
	Covina Valley Community Hospital 845 N. Lark Ellen Avenue West Covina, California 91790	(626) 339-5451

Directions to Hospital:

East on Live Oak Avenue

To Arrow Highway, Arrow Highway East

To Lark Ellen, South on Lark Ellen

Hospital will be on the left.

See Figure 2 for the route to hospital map.

Appendix A
Health And Safety Forms

20.0 Certification

This HASP has been reviewed and approved by the Health and Safety Manager. The plan satisfies the requirements of the Occupational Safety and Health Act 1910.120 as implemented by the Health and Safety Committee for hazardous waste site activities.

_____

Health and Safety Manager

All site personnel have read the HASP and are familiar with its provisions.

Appendix A
Health And Safety Forms

Appendix B
Drilling Safety Guidelines

The drilling rig operator is responsible for drill rig maintenance and safety. The following information is provided as general guidelines for safe practices on site.

B.1 OFF-ROAD MOVEMENT FOR DRILL RIGS

The following safety guidelines relate to off-road movement of drill rigs:

- Before moving a drill rig, first walk the route of travel, inspecting for depressions, slumps, gullies, ruts, and similar obstacles
- Always check the brakes of a drill rig carrier before traveling, particularly on rough, uneven, or hilly ground
- Discharge all passengers before moving a drill rig on rough or hilly terrain
- Engage the front axle for 4x4 or 6x6 vehicle or carriers when traveling off the highway on a hilly terrain
- Use caution when traveling on a side-hill. Conservatively evaluate the side-hill capability of drill rigs, because the arbitrary addition of drilling tools may raise the center of mass. When possible, travel directly uphill or downhill.
- Attempt to cross obstacles such as mall logs, small erosion channels or ditches squarely, not at an angle
- When lateral or overhead clearance is close, use the assistance of someone on the ground as a guide
- After the drilling has been moved to a new drilling site, set all brakes and/or locks. When grades are steep, block the wheels
- Never travel off-road with the mast (derrick) of the drill rig in the raised or partially raised position
- Tie down loads on the drill rig and supporting trucks during transports.

B.2 OVERHEAD AND BURIED UTILITIES

Special precaution must be taken when drilling on a site with electrical power lines and other utilities in the vicinity. Electricity can shock, burn, and result in death.

Overhead and buried utilities should be located, noted, and emphasized on all boring location plans and assignment sheets. When overhead electrical power lines exist at or near a drilling site or project, consider all wires to be alive and dangerous.

Watch for sagging power liens before entering a site. Do not lift power lines to gain entrance. Telephone the appropriate utility company and ask them to lift or raise the lines and de-energize (turn off power) them.

Walk completely around the drill rig before raising the drill rig mast (derrick) on a site in the vicinity of power liens. Determine what the minimum distance from any point on the drill rig to the

nearest power line will be when the mast is raised and/or is being raised. Do not raise the mast or operate the drill rig if this distance is less than 20 feet. Remember that hoist lines and overhead power lines can move toward each other by the wind.

If there are any questions concerning the safety of drilling on the site in the vicinity of overhead power lines, telephone the power company. The power company will provide expert advice at the drilling site as a public service and at no cost.

Underground electrical lines are as dangerous as overhead lines. Be aware and always suspect the existence of underground utilities such as electrical power, gas, petroleum, telephone, sewer, and water. Ask for assistance:

- If a sign warning of underground utilities is located on a site boundary; do not assume that underground utilities are located on or near the boundary or property line under the sign: Telephone the utility company and check it out. The underground utilities may be a considerable distance away from the warning sign.
- Always contact the owners of utility lines or the nearest underground utility location service before drilling. The utility personnel should determine the location of underground lines, and mark and flag these locations. Determine, with the utility personnel what specific precautions must be taken to assure safety.

B.3 CLEARING THE WORK AREA

Prior to drilling, adequate site cleaning and leveling should be performed to accommodate the drill rig and supplies and provide a safe working area. Drilling should not be commenced when tree limbs, unstable ground or site obstructions result in unsafe tool handling conditions.

B.4 HOUSEKEEPING ON AND AROUND THE DRILL RIG

To complete the first requirement for safe field operations, the safety supervisor or the drilling crew must understand and fulfill his responsibility for maintenance and "housekeeping" on an around the drill rig. Suitable storage locations should be provided for all tools, materials, and supplies. Therefore, they can be conveniently and safely handled without hitting or falling on a member of the drill crew or a visitor.

Avoid storing or transporting tools, materials, or supplies within or on the mast (derrick) of the drill rig. Pipe, drill rods, bits, casing, augers, and similar drill tools should be stacked in an orderly manner on racks or sills to prevent spreading, rolling, or sliding.

Penetration hammers or other types of driving hammers should be placed at a safe location on the ground or secured to prevent movement when not in use. Work areas, platforms, walkways, scaffolding, and other access ways should be kept free of materials, obstructions, and substances such as ice, excess grease, or oil that could cause a surface to become slick or otherwise hazardous.

Keep all controls, control linkages, warning and operation lights and lenses, free of oil, grease, and/or ice.

Do not store gasoline in any portable container other than a non-sparking, red container with a flame arrestor in the fill spout. The work "gasoline" must be clearly visible on the container.

B.5 USE OF HAND TOOLS

There are many kinds of hand tools that can be used on or around a drill rig. The most important rule is "use the tool for its intended purpose." The following are a few specific and general suggestions that apply to the safe use of several hand tools often used on and around drill rigs.

- When a tool becomes damaged, either repair it before using it again or discard it
- When using a hammer, any kind of hammer, for any purpose, were safety glasses and require all others near you to do the same.
- When using a chisel, any kind of chisel, for any purpose, wear safety glasses and require all others around you to do the same.
- Keep all tools cleaned and stored in an orderly manner when not in use
- Replace hook and heel jaws when they become visibly worn
- When breaking tool joints on the ground or on a drilling platform, position your hands so that your fingers will not be caught between the wrench handle and the ground or the platform, should the wrench slip or the joint suddenly let go.

B.6 USE OF HOISTS, WIRE ROPE, AND HOISTING HARDWARE

The use of wire line hoists, wire rope, and hoisting hardware should be performed as stipulated by the American Iron and Steel Institute's Wire RPE Users Manual.

All wire ropes and fittings should be visually inspected during use, and thoroughly inspected at least once a week for: abrasion, broken wires, wear, reduction in rope diameter, reduction in wire diameter, fatigue, corrosion, damage from heat, improper weaving, jamming, crushing, bird caging, kinking, core protrusion and damage to lifting hardware, and any other feature that would lead to failure. Wire ropes should be replaced when an inspection indicates excessive damage according to the Wire RPE Users Manual.

If a ball-bearing type hoisting swivel is used to hoist drill rods, swivel bearings should be inspected and lubricated on a daily basis to assure that the swivel freely rotates under load. If a rod slipping device is used to hoist drill rods, do not drill through or rotate drill rods through the slipping device. Do not hoist more than 1 foot (0.3 m) of the drill rod column above the top of the mast (derrick) and do not hoist a rod column with loss took joints while the rod column is being supported by a

slipping device. If drill rods slip back into the borehole, do not attempt to break the fall of the rods with your hands.

Most sheaves on drill rigs are stationary with a single part line. The number of line parts should never be increased without first consulting with the manufacturer of the drill rig. Wire ropes must be properly matched with each sheave.

The following procedures and precautions must be understood and implemented for safe of wire ropes and rigging hardware:

Use tool handling hoists only for vertical lifting of tools (except when angle hole drilling). Do not use tool handling hoists to pull on objects away from the drill rig; however, drills may be moved by using the main hoist as the wire rope is spooled through property sheaves according to the manufacturer's recommendations.

When stuck tools or similar loads cannot be raised with a hoist, disconnect the hoist line and connect the stuck tools directly to the feed mechanism of the drill. Do not use hydraulic leveling jacks for added pull to the hoist line or the feed mechanism of the drill.

When attempting to pull out a mired vehicle or drill rig carrier, only use a winch on the front or rear of the vehicle or drill rig carrier and stay as far away as possible from the wire rope. Do not attempt to use tool hoists to pull out a mired vehicle or a drill rig carrier.

Minimize the shock loading of a wire rope - apply loads smoothly and steadily. The following general safety principles should be observed.

- Protect wire rope from sharp corners or edges
- Replace faulty guides and rollers
- Replace worn sheaves or worn sheave bearings
- Replace damaged safety latches on safety hooks before using.
- Know the safe working load of the equipment and tackle being used, and never exceed this limit
- Periodically inspect and test clutches and brakes of hoists
- Know, and do not exceed the rated capacity of hooks, rings, links, swivels, shackles, and other lifting aids.
- Always wear gloves when handling wire ropes
- Do not use your hands to guide wire ropes on hoist drums
- Following the installation of a new wire rope, first lift a light load to allow the wire rope to adjust

- Never carry out any hoisting operations when the weather conditions will create hazards to personnel, the public, or property
- Never leave a load suspended in the air when the hoist is unattended
- Keep you hands away from hoists, wire rope, hoisting hooks, sheaves, and pinch points when the slack is being taken up, and when the load is being hoisted
- Never hoist the load over the head, body, or feet of any personnel.

B.7 USE OF AUGERS

The following general procedures should be used when advancing a boring with continuous flight or hollow-stem augers:

- Prepare to start an auger boring with the drill rig level, the clutch or hydraulic rotation control disengaged, the transmission in low gear, and the engine running at a low RPM
- The operator and tool handler should establish a system of responsibility for the series of various activities required for auger drilling, such as connecting and disconnecting auger sections, and inserting and removing the auger fork. The operator must assure that the tool handler is well away from the auger column and that the auger fork has been removed before starting rotation
- Only use the manufacturer's recommended method of securing the auger to the power coupling. Do not touch the coupling or the auger with your hands, a wrench, or any other tool during rotation
- Whenever possible, use tool hoists to handle auger sections
- Never place your hands or fingers under the bottom of an auger section when hoisting the auger over the top of the auger section in the ground or other hard surface such as the drill rig platform
- Never allow your feet to get under the auger section that is being hoisted
- When rotating augers, stay clear of the rotating auger and other rotating components of the drill rig. Never reach behind or around a rotating auger for any reason
- Never use your hands or feet to move cuttings away from the auger
- Augers should be cleaned only when the drill rig is in neutral, and the augers have stopped from rotating.

B.8 START-UP PROCEDURES

All drill rig personnel and visitors should be instructed to "stand clear" of the drill rig immediately prior to and during the starting of an engine. Before starting a drill rig engine, make sure that all of the gear boxes are in neutral, all hoist levers are disengaged, all hydraulic levers are in the correct non-actuating positions, and the cathead rope is not on the cathead.

B.9 SAFETY DURING DRILLING OPERATIONS

Safety requires the attention and cooperation of every worker and site visitor. The following procedures are related to safety during drilling operations:

Do not drive the drill rig from hole to hole with the mast (derrick) in the raised position. Before raising the mast (derrick), look up to check for overhead obstructions.

Before raising the mast (derrick), clear all drill rig personnel (with the exception of the operator) and visitors from the areas immediately to the rear and the sides of the mast. In addition, inform them that the mast is being raised.

Before the mast (derrick) of a drill rig is raised and drilling is commenced, the drill rig must first be leveled and stabilized with leveling jacks and/or solid crabbing. The drill rig should be re-leveled if it settles after the initial set up. Lower the mast (derrick) only when leveling jacks are down, and do not raise the leveling jack pads until the mast (derrick) is completely lowered. Before starting drilling operations, secure and/or lock the mast (derrick), if required by the drill manufacturer's recommendations.

The drill rig operator should operate a drill rig only from the position of the controls. The operator should shut down the drill engine before leaving the vicinity of the drill. "Horsing around" within the vicinity of the drill rig and tool and supply storage areas is strictly prohibited, even when the drill rig is shut down. Watch for slippery ground when mounting/dismounting the platform. Drilling operations should be terminated during an electrical storm. Consuming alcoholic beverages, depressants, stimulants, or any other chemical substance while on the job is strictly prohibited.

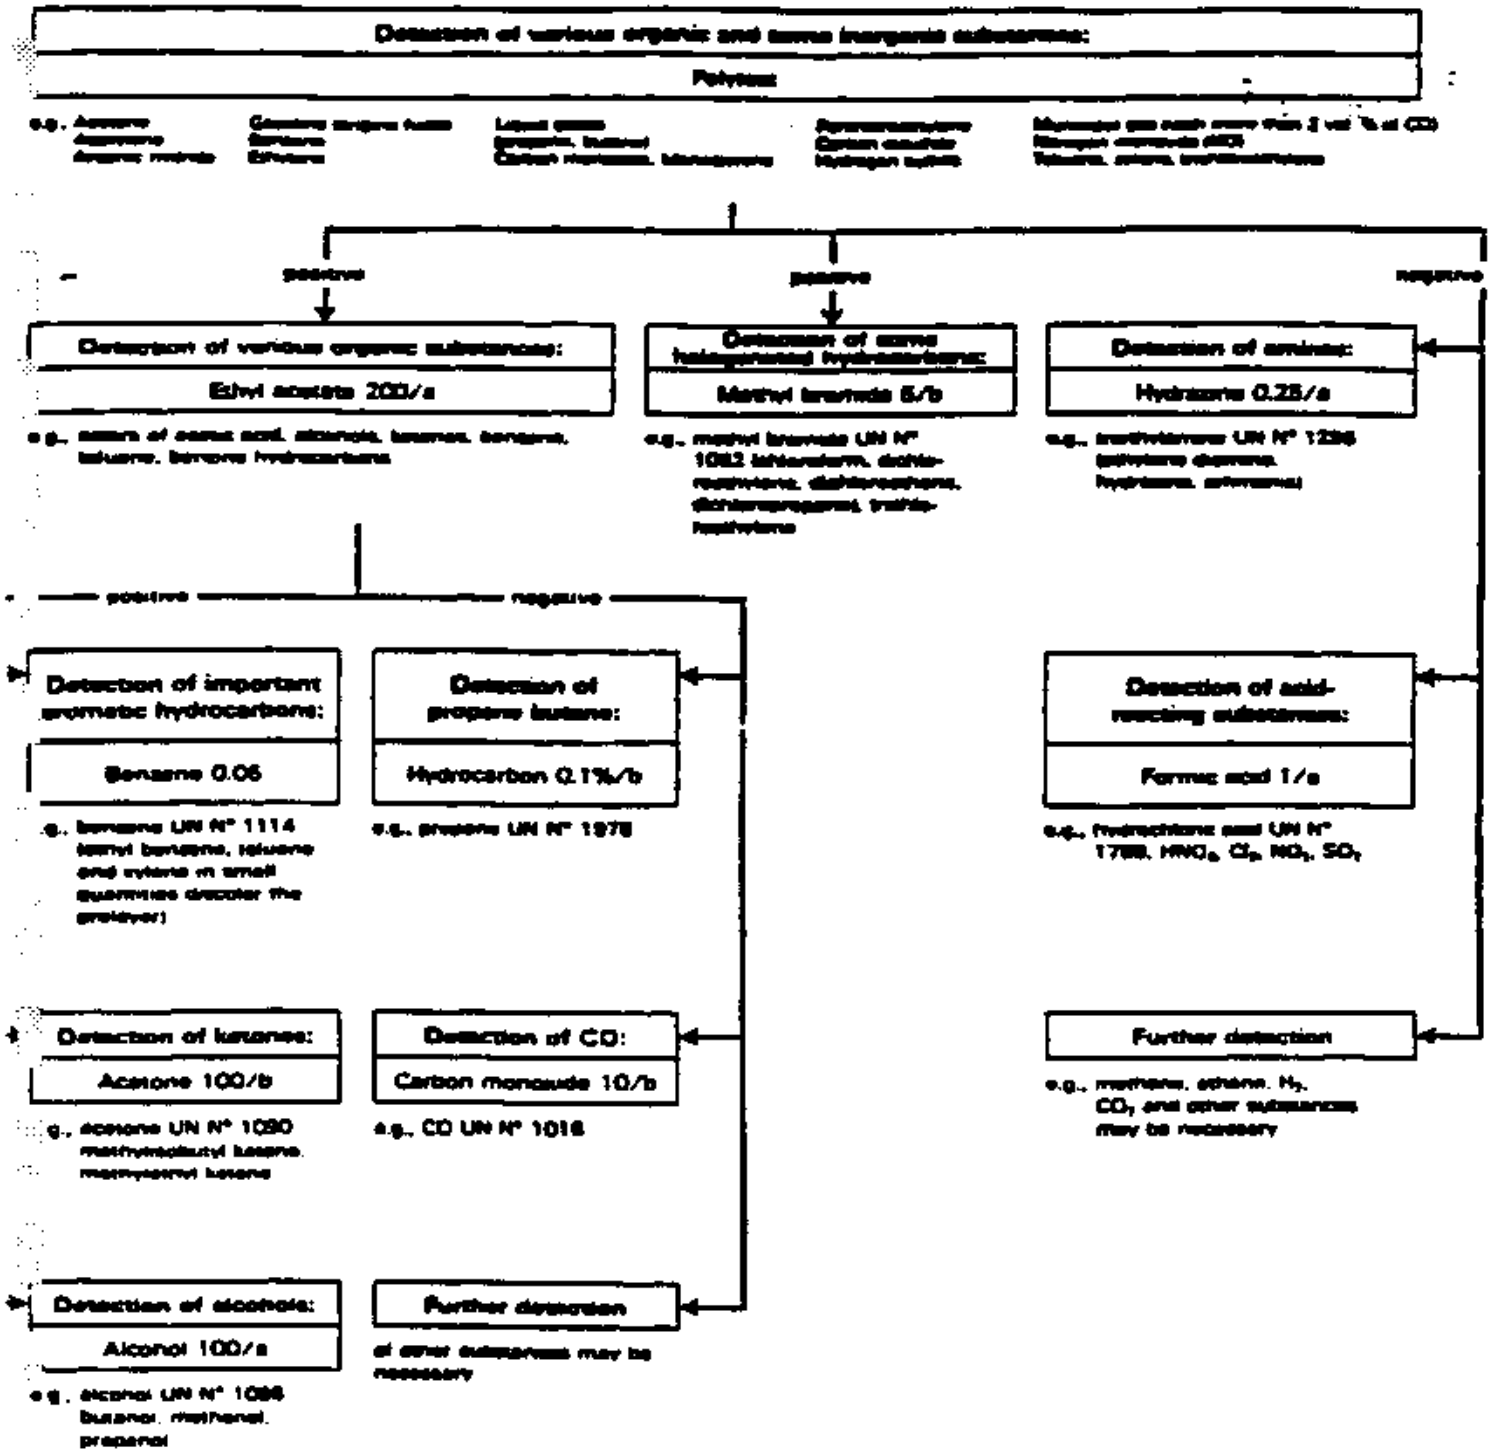
All unattended boreholes must be adequately covered or otherwise protected to prevent drill rig personnel, site visitors or animals from stepping or falling into the hole. When the drilling project has been completed, all open boreholes should be covered, protected or backfilled adequately and according to local or state regulations.

B.10 SAFETY WHEN LIFTING

Be careful when lifting heavy objects. Before lifting, approach the object by bending at the knees, keeping your back in a vertical position and unarched while obtaining a firm footing. Grasp the object firmly with both hands and stand slowly and squarely while keeping you back vertical and unarched. Perform the lifting with the muscles in your legs, not with the muscles in your lower back.

Appendix C
Draeger Tube Decision Tree

Detection of unknown substances by means of DRAEGER detector tubes*



*Important: This sample taking schedule refers to a selection of substances which occur frequently in practice. Other structures may necessitate another sequence of measurements and, the case being, the use of additional detector tubes, or measurements according to other procedures must be carried out.

C29-C32	ND	
C33-C36	ND	
C7-C36 Total	ND	5

Normal paraffins are used to identify the reported carbon chain ranges. However, there can be a discrepancy for branched, unsaturated, or multiple ring hydrocarbons wherein they may be detected outside of the normal paraffin defined carbon chain range.

UST Closure Investigation
Irwindale Office Building
14005 Live Oak Avenue
Irwindale, California

Subject: LACDPW CLOSURE PERMIT #7963B

C 45H172

Message: Mr. Ofo: Attached is the title page of a soil boring investigation report dated November 1, 2000 that presents the results of a UST closure investigation for the subject site. The USTs were removed in 1991 and additional investigation was requested by LACDPW prior to issuing closure. The subsequent investigation was performed in accordance with a July 2000 meeting and August 10, 2000 work plan approved by LACDPW.

Along with the work plan, a check amounting to $535 ($401 "initial fee" and $135 one hour "maximum billed oversight fee") for entering into the Voluntary Cleanup Oversight program was also submitted to your attention. These submittals were made pursuant to our August 2, 2000 meeting at your office.

Results of the investigation indicated no detectable hydrocarbons in the soil matrix analyses and only low levels of total lead (less than 5.5 mg/kg). On the basis of these results, URS recommended closure for the former UST area. It should be noted, however, that we never received a copy of the closure letter from LACDPW. Please check your files and forward a copy to my attention at your earliest convenience.

Best Regards,

Taras B. Kruk

Mr. Kruk:

At the time of our discussion, a closure letter was indeed prepared and forwarded for typing, however, due to unusual backlog and secretarial manpower shortage at the time, that letter was not finalized as expected. It will be forwarded to the new secretary for completion immediately.
Thank you for your patience.

TANK CLOSURE REPORT

prepared for

RUDY'S SERVICE STATION
REPAIR AND MART, INC.
United Consumer Club Corporation
16871 Beach Blvd. Suite 204
Huntington Beach, California

prepared by

TERRA TECH LABS, Inc.
Huntington Beach, California

April 1990

INTRODUCTION

The United Concrete Pipe Corporation located at 14041 East Live Oak Avenue in the City of Irwindale, California had used a waste oil system consisting of a 500 gallon concrete sump piped to a 3,000 gallon steel storage tank. In order to comply with the Los Angeles County Public Works Department, Waste Management Division's underground storage tank regulations, United Concrete Pipe Corporation requested the permanent closure of this tank, including removal of the sump and all associated piping. Closure permit #5418B was issued March 16, 1989 (Appendix A). The tank and sump were removed from the ground on March 23, 1989 by Rudy's Service Station Repair and Maint., Inc. of South El Monte, California. The tank was triple rinsed and this rinsate material manifested and taken to Petroleum Recylcing Center in Signal Hill, California (Appendix B). The tank was then rendered inert and certified clean by Harbor Testing Laboratory (Appendix C). The tank was removed from the site the same day by American Metal Recycling in Ontario, California (Appendix D). Soil sampling and laboratory analyses to determine the past integrity of the tank and future use of the soil was peformed by TERRA TECH LABS, Inc. on March 31, April 13 and April 14, 1989. All excavated soil was stockpiled adjacent to the tank pit pending laboratory analyses.

PROCEDURE

Two soil samples were collected from this site on March 31, 1989. One sample each (S2 and S1) was collected from two beneath the north and south ends.

respectively, of the tank (ten feet below ground surface). See Figure 1 for sample locations. These samples were collected under the direction and supervision of Mr. Tony Palagyi, Inspector for the Los Angeles County Department of Public Works Waste Management Division.

On April 13, 1989 two additional samples (S3 and S4) were collected from four and six feet beneath the south end of the 3,000 gallon waste oil tank excavation, respectively (fourteen and sixteen feet below ground surface). One sample (SP1) was also collected from the surrounding spoils pile. See Figure 2.

On April 14, 1989 an additional six samples were collected from the tank excavation. Two samples (S5 and S6) were collected from the north and south ends of the tank excavation at a depth of approximately seventeen feet below ground surface. One sample each (NW, SW, EW and WW) was collected from the north, south, east and west walls, respectively. These wall samples were collected at a depth of sixteen feet below ground surface. See Figure 2 for sample locations. This sampling was overseen by Mr. Tony Palagyi of the Los Angeles County Department of Public Works.

The contaminated soil removed from the excavation was segregated into five spoils piles and the United Concrete Pipe Company requested that TERRA TECH LABS, Inc. return to the site to sample these spoils piles. On June 1, 1989 five samples (SP1-SP5) were collected from the site, one from each spoils pile. See Figure 3 for spoils pile locations and sample locations.

The soil samples were collected with a clean trowel that was washed with trisodium phosphate (TSP), rinsed in distilled water and air dried before each sample

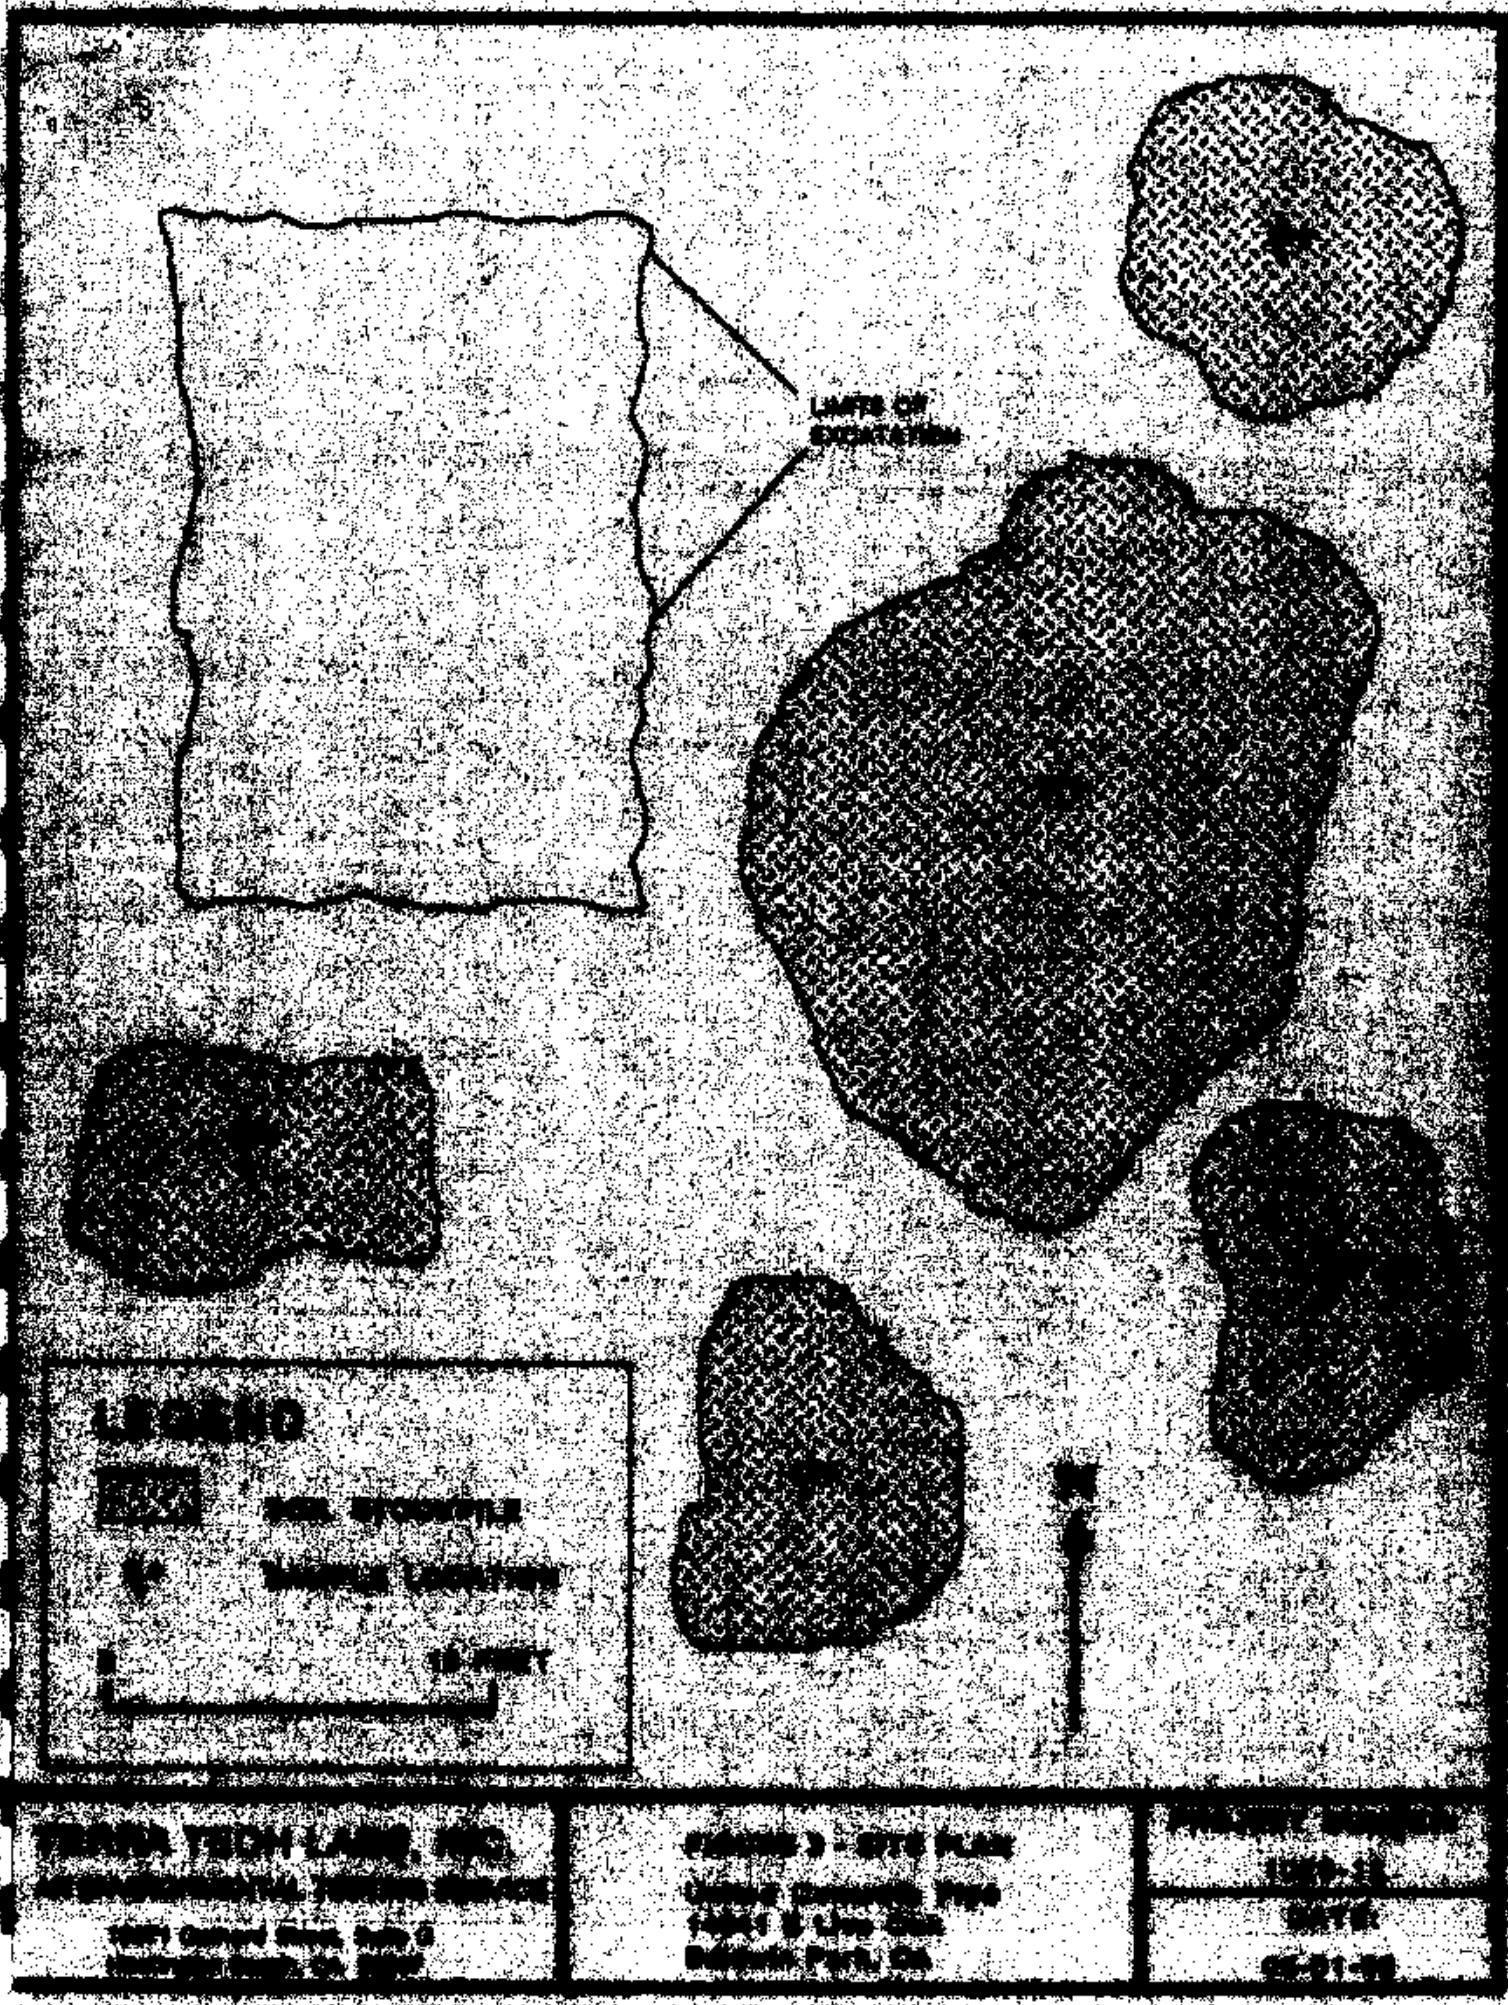
TERRA TECH LABS, INC. AN ENVIRONMENTAL TESTING SERVICE 1871 Oakrise Street, Suite 4 Rancho Cordova, CA 95670	FIGURE 2 - SITE PLAN United Gasoline, Inc. 14041 E. Live Oak Baldwin Park, CA	PROJECT NUMBER: 1995-11 DATE: April, 1995



LIMITS OF
EXCAVATION

was collected. The samples were packed in sterile 8 oz., open mouth glass jars until full, thus allowing no headspace. The jars were then sealed with screw-top caps containing Teflon liners, labeled, and stored in a cooler with ice to maintain laboratory storage temperatures of approximately 4 degrees Centigrade until mobile analyses could be performed. Chain-of-Custody records were completed for each sample to ensure traceability (Appendix E). These samples were collected from the center of the bucket of a backhoe and gradall after soil had been removed down to the aforementioned depths.

Visual inspection of the tank revealed no evidence of leakage or spillage. No odors or staining were evident in the tank excavation. Ground water was not observed in the tank excavation. According to the Los Angeles County Flood Control District's well # 3020G as of October 1988, the depth to ground water adjacent to this site was 159.2 feet below ground surface.

The soil samples were submitted to TERRA TECH LABS, Inc. of Huntington Beach, California on March 31, April 13, April 14, and June 1, 1989. The analysis specified and performed for the samples collected was in accordance with EPA Method 418.1. This method utilizes a solvent (Freon-113) extraction and then analysis with an infrared spectrophotometer (IR). The two original samples collected from the tank excavation (S1 and S2) were also analyzed in accordance with EPA Method 8020 for volatile aromatics.

LABORATORY RESULTS

Chemical analysis of the soil samples collected on March 31, 1989 revealed

sample S1 to have a detectable total recoverable petroleum hydrocarbon concentration of 4780 mg/kg and sample S2 to have a detectable total recoverable petroleum hydrocarbon concentration of 33.1 mg/kg. Sample S2 revealed no detectable volatile aromatic concentrations and sample S1 revealed no detectable benzene, ethylbenzene or total xylene concentrations. Sample S1 revealed a very low detectable level of toluene (0.58 mg/kg). According to the Los Angeles County Department of Public Works, the generally accepted action limit for petroleum hydrocarbons is 100 mg/kg. Therefore, further excavating, sampling and analyses were performed on April 13 and 14, 1989.

Chemical analysis of the two samples (S3 and S4) collected from the south floor of the tank excavation on April 13, 1989 revealed total recoverable petroleum hydrocarbon concentrations of 259 and 202 mg/kg, respectively. The spoils pile sample collected on this date revealed a total recoverable petroleum hydrocarbon concentration of 318 mg/kg. Since these soil samples exceeded the action limit, additional samples were required. Chemical analysis of the six samples (S5, S6, NW, SW, EW and WW) collected on April 14, 1989 revealed total recoverable petroleum hydrocarbon concentrations of ND, 77.7 mg/kg, ND, 30.4 mg/kg, ND and 93.8 mg/kg, respectively (where ND means not detected at 1.0 mg/kg). These samples were not analyzed by EPA Method 8020 for volatile aromatics because the most contaminated sample (S1) did not reveal any significant volatile aromatic concentrations. Because all of these deeper floor and wall samples revealed total recoverable petroleum hydrocarbon concentrations less than the generally accepted action level of 100 mg/kg,

no further sampling or analyses were performed from the tank excavation. See Appendix F for all laboratory results.

The contaminated soil that was removed from the excavation was stockpiled adjacent to the tank excavation while disposal and treatment options are explored. Chemical analysis of the five soil samples collected from the surrounding spoils piles revealed total recoverable petroleum hydrocarbon concentrations of 545, 1500, 1150, 644 and 649 mg/kg (samples SP1-SP5, respectively). See Appendix F. United Concrete Pipe Corporation decided to haul their contaminated soil to a Class 1 Hazardous Waste Facility, but only after a waste minimization process. This waste minimization process was performed in order to remove the rocks and boulders from the soil because of the much lower surface area to weight ratio (representing contaminated soil) of the larger particles (the rocks and boulders). This process was verbally approved by Ms. Nichole Long of the Los Angeles County Department of Public Works (Appendix G). All material from the excavation was passed over a one inch opening screen powered by pneumatic vibrators. Undersize (less than one inch) material was hauled to the Class 1 landfill, while oversize (greater than one inch) material was used as part of the backfill. Approximately one hundred fifty two tons of contaminated soil was removed from this site and sent to Casmalia Resources in Casmalia, California (Appendix H).

The preceding sampling procedures were reviewed and found acceptable by a California Registered Geologist whose validation appears below:

OF NO OXYGEN.
SAFE FOR HOT WORK TO
CUT TANK IN TO SCRAP.
THE TANK CONTAINS THREE
UNDERGROUND LINES. NO HOT WORK
NEAR LINES FEEDING LINES
FROM TANK.
NO GAS IN AIR. THE
ENTIRE TANK INERTED
WITH WATER.

In the event of any physical or atmospheric changes adversely affecting the STANDARD SAFETY DESIGNATIONS assigned to any of the above spaces, or if in any doubt, immediately stop all work and contact the undersigned Marine Chemist

QUALIFICATIONS: Transfer of ballast or manipulation of valves or closure equipment tending to alter conditions in pipe lines, tanks or compartments subject to gas accumulation, unless specifically approved in this Certificate, requires inspection and endorsement or release of Certificate for the spaces so affected. All lines, vents, heating coils, valves, and similarly enclosed appurtenances shall be considered "not safe" unless otherwise specifically designated.

STANDARD SAFETY DESIGNATIONS (partial list, paraphrased from NFPA 306-1980, Subsections 1-8.1 through 1-8.4, and Subsection 5-3.2).

SAFE FOR WORKERS: Means that in the compartment or space so designated: (a) the oxygen content of the atmosphere is at least 19.5 percent by volume; and that, (b) toxic materials in the atmosphere are within permissible concentrations; and that, (c) the residues are not capable of producing toxic materials under existing atmospheric conditions while maintained as directed on the Marine Chemist's Certificate.

NOT SAFE FOR WORKERS: Means that in the compartment or space so designated, the requirements of Safe for Workers has not been met.

SAFE FOR HOT WORK: Means that in the compartment so designated: (a) oxygen content of the atmosphere is at least 19.5 percent by volume, with the exception of inerted spaces or where external hot work is to be performed; and that, (b) the concentration of flammable materials in the atmosphere is below 10 percent of the lower flammable limit; and that, (c) the residues are not capable of producing a higher concentration than permitted by (b) above under existing atmospheric conditions in the presence of fire, and while maintained as directed on the Marine Chemist's Certificate; and further, that, (d) all adjacent spaces containing or having contained flammable or combustible materials have been cleaned sufficiently to prevent the spread of fire, or are satisfactorily inerted, or, in the case of fuel tanks or lube oil tanks or engine room or fire room bilges, have been treated in accordance with the Marine Chemist's requirements.

NOT SAFE FOR HOT WORK: Means that in the compartment so designated, the requirements of Safe for Hot Work have not been met.

CHEMIST'S ENDORSEMENT. This is to certify that I have personally determined that all spaces in the foregoing list are in accordance with NFPA 306-1980 Control of Gas Hazards on Vessels and have found the condition of each to be in accordance with its assigned designation.

"The undersigned acknowledges receipt of this Certificate under Section 2-3 of NFPA 306-1980 and understands conditions and limitations under which it was issued."

This Certificate is based on conditions existing at the time the inspection herein set forth was completed and is issued subject to compliance with all qualifications and instructions.

Alhambra, CA 91802-1460

Attention: Ms. Nichole Long

Dear Ms. Long:

We have acted upon your verbal approval and backfilled the excavation remaining after removal of our 3,000 gallon waste oil tank.

About one-third of the backfill material was boulders and rocks - the oversize from the 1 inch screening process. The 151.68 tons of undersize was hauled to Casmalia Resources on June 19, 1989.

The screening process resulted in an estimated one-third reduction of material that had to go to disposal. Tony Palagyi of your organization's Arcadia office observed our screening operation. I wish your schedule had permitted you to check it out. I expect, however, that another opportunity will soon come up.

In the meantime, we'll be working on the details needed for completion of this project.

Thanks.!

Sincerely,

Bill Richardson
Principal Project Engineer

GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

Atten: Waste Management Division

SUBJECT: TANK CLOSURE REPORT
FILE NUMBER 593, PERMIT NUMBER 8058

20039

Dear Mr. Sjoberg,

On behalf of Hughes Markets, Woodward-Clyde Consultants (Woodward-Clyde) is submitting this report regarding the removal of an underground storage tank at 14041 East Live Oaks Avenue, Irwindale, California (Figure 1). This report addresses the items listed in the Los Angeles County Department of Public Works closure report checklist (Attachment A). The tank was a 2000 gallon steel tank containing a waste oil. Figure 2 shows the location of the tank.

The tank was removed on April 23, 1991 in accordance with conditions specified in permit number 8058, file number 593. The general contractor for the removal was J. D. Edwards at 11711 Clark Street, Unit 110, Arcadia, California 91006. They employed the following additional subcontractors:

- Nieto & Sons Trucking, Inc., Brea, California
  (cleaned tanks and hauled and disposed of liquid waste)

- CTL Environmental Services, Harbor City, California
  (Certified Industrial Hygienist)

Woodward-Clyde personnel documented the removal of the tank and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. During the tank removal activities, the air in and around the tank excavation was monitored for volatile organics with an organic vapor analyzer (OVA). The OVA readings were near background (1.5 ppm). The tank was pumped and certified "clean" by a certified industrial hygienist, and was then transported to American Metal Recycling, Inc. 2202 South Milliken Avenue, Ontario, California for disposal. Documentation of the removal, certification, and proper disposal of the tank is included in Attachment B.

Soil samples were collected beneath the ends of the tank (at an approximate depth of 15 feet below grade) as specified in the removal permit. The samples were collected using a backhoe to excavate soil from the desired depth, and then collecting a sample from the bucket of the backhoe, using a spatula. The soil appeared dark and oil stained and had an odor of oil. The samples were grab samples (no borings were drilled), and were collected within one half hour after the tank was removed (between 1:30 and 1:45 pm). They were stored on ice and transported with chain-of-custody documentation to West Coast Analytical Service, Inc. for analysis for total petroleum hydrocarbons (TPH) by EPA Method 418.1 and for volatile aromatic hydrocarbons by EPA Method 8020. Laboratory reports and chain-of custody forms are included in Attachment C.

The analytical results revealed 10,900 and 17,000 mg/kg of TPH in the soil beneath the tank. Ethylbenzene, toluene and total xylenes were also detected in concentrations ranging from 270 to 22,000 ug/kg. Additional work has been completed to define the extent of TPH near the waste oil tank. Refer to the report entitled "Investigation of Waste Oil Tank at 14041 East Live Oak Avenue, Irwindale, California" for additional site characterization.

Given the nature of the contamination and the proximity to a major highway (Arrow Highway), in-situ bioremediation is being considered as a preferred remedial alternative.

CERTIFICATION

I have reviewed this report and declare that the information included herein is true and accurate and complete to the best of my knowledge.

DEPARTMENT OF PUBLIC WORKS
CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 1460, Alhambra, CA 91802-1460, containing:

1. File number of facility and closure permit number.
2. Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.
3. Description of methods for obtaining, handling and transporting samples.
4. Time and date samples were obtained.
5. If borings were established, boring logs certified by a CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.
6. Chain-of-custody documentation initiated by person obtaining sample through person at State Department of Health Services certified laboratory.
7. Disposal destination of tanks and evidence of legal disposal.
8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.
9. Documentation as to depth of groundwater at facility.
10. Manifests to document hazardous waste disposal of any removed soil.
11. Any observations of site contamination.
12. Remedial action plan to mitigate contamination.
13. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.

Signature John D Edwards Date 4-16-91

Certificate of Treatment/Recycling

ISSUED TO

United Conveyor Pipe

FOR

MANIFEST NUMBER 9032103 4 DATE RECEIVED 4-29-91

The aqueous waste received on the above manifest will be treated to standards mandated by the FEDERAL CLEAN WATER ACT and to effluent requirements established by the Sanitation Districts of Los Angeles County. Waste treatment and recycling is performed under permits granted to DeMENNO/KERDOON, a California corporation, by the California Department of Health Services, in coordination with the Environmental Protection Agency, in accordance with the provisions of the Resource Conservation and Recovery Act (RCRA) of 1976, together with applicable federal and state regulations including but not limited to waste discharge requirements established by the Sanitation Districts of Los Angeles County.

When the above described waste material is accepted by DeMENNO/KERDOON and treated/recycled and the aqueous phase discharged for further treatment by the Sanitation Districts, the certificate holder's responsibility for the waste material is eliminated under both RCRA and Proposition 65. Upon request, DeMENNO/KERDOON will issue this certificate that all waste material has been handled in accordance with applicable permits and the certificate holder's liability has been terminated.

DeMENNO/KERDOON

TANK SITE 14041 East Live Oak Avenue
Irwindale, California

INVESTIGATION Inspect and certify the tank(s) to be clean and vapor-free. The inspection was conducted on April 23rd, 1991, by Stuart E. Salot, Ph.D, C.I.H.(#1433 and 1973).

METHOD The tank(s) was/were inspected for explosive atmosphere utilizing an MSA type 2A Explosivity Meter. Visual Inspection(s) of the interior was/were performed to ensure that no visible deposits, sludge or foreign materials remained.

RESULTS The tank(s) was/were inspected and found to be vapor-free (LEL of zero percent) and deemed clean.

Certificate numbers 2409, 2410, and 2435.

Respectfully submitted,
CTL Environmental Services

Stuart E. Salot O.K

1.0
INTRODUCTION

During grading operations at the former United Concrete Pipe (UCP) facility in Irwindale, California, (Figure 1), an underground tank was encountered. The contents, age and integrity of the tank were unknown. On April 16, 1991, an investigative program was initiated, the purpose of which was to identify the contents of the tank, remove the tank, and evaluate the presence and extent of petroleum hydrocarbons in the subsurface as a result of leakage from the tank. The purpose of this report is to document the work conducted and the results obtained to date.

1.1 SITE DESCRIPTION

The area of interest was formerly part of a larger 74-acre parcel that was owned and occupied by United Concrete Pipe. The address of the 74-acre parcel was 14041 East Live Oak Avenue, Irwindale, California. It is located just east of the San Gabriel River Channel and just south of the Santa Fe Dam. In this area, groundwater is present at a depth of 180 to 200 feet. Mission Koll I bought the entire facility from United Concrete Pipe, then sold a part of the property to the City of Irwindale. The resulting two parcels are shown on Figure 2. The former location of the waste oil tank is shown on this figure. Mission Koll I then subdivided their parcel as shown on Figure 3 and sold the section on which the waste oil tank is located to Hughes Markets in March of 1991. Thus the portion of the site on which the tank was located is now owned by Hughes Markets.

2.1 PRELIMINARY EVALUATION OF WASTE OIL TANK

On April 16, 1991, Woodward-Clyde personnel first inspected the area where the waste oil tank was located. At that time, there was a large conical excavation, approximately 15 feet deep and 20 feet in diameter with an adjacent rectangular excavation approximately 15 feet by 30 feet by 4 feet deep (see Figure 4). A photograph of the tank excavation is presented in Appendix A (Photograph 1).

One sample of the tank contents ("Product") was collected and four soil samples were collected from the excavation (Samples 1X through 4X). Two samples (1X and 4X) were collected from the soil that appeared stained and weathered and two samples were collected from soil that appeared clean or unstained (Samples 3X and 2X).

During the investigation, organic vapor monitoring was performed using an organic vapor analyzer (OVA). An OVA reading of 5 to 8 ppm was obtained when the instrument was held close to the liquid from the tank. The remaining readings around the excavation were all near background (2 ppm).

2.2 WASTE OIL TANK REMOVAL

On April 23, 1991, Woodward-Clyde personnel witnessed the removal of the tank. The contents of the tank were pumped into a tanker truck (Appendix A, Photograph 2) and then the tank itself was removed. The soil in the tank excavation appeared oil-stained. A soil sample was collected approximately 3 feet below each end of the tank: Sample 3A-1 was collected from the west end and Sample 3A-2 was collected from the east end (see Figure 4). The samples were collected from the bucket of a backhoe and placed in clean glass jars. The samples were stored on ice until transported to laboratory using standard chain-of-custody procedures.

The bottom of the excavation was at 15 feet, and oil-impacted soil appeared to extend below this depth. The backhoe also excavated some soil near the property fence line on the north side of the tank to obtain an estimate of the lateral extent of the contamination in that direction. The impacted soil appeared to extend off site towards Arrow Highway. During the excavation and sample collection, the soil and air were monitored for volatile organics using an organic vapor analyzer (OVA). All of the readings were near background levels of 1 to 2 ppm.

2.3 EVALUATION OF THE EXTENT OF OIL IMPACTED SOIL

In order to evaluate the vertical and lateral extent of the oil-impacted soil, five borings were drilled in the vicinity of the tank. The first boring (P4) was drilled on May 17, 1991. Since subsurface conditions in the area are characterized by the presence of large cobbles and boulders, it was necessary to use an air percussion drill rig (a Becker rig). The boring was drilled at the southwest end of the former tank. The location of the boring is shown on Figure 5. Soil samples could only be collected at 30, 35 and 50-foot depths due to the cobbles in the soil. OVA headspace readings were obtained every 5 feet. The highest reading was 68 ppm, at a depth of 35 feet. At 55 feet deep (the bottom of the boring) an OVA reading of 20 ppm was obtained. The boring was stopped at 55 feet, and was backfilled with a cement\bentonite mixture.

Evaluation of the data on the samples collected from the first boring suggested the need for additional drilling, soil sampling and analyses. During the week of August 12, 1991, four additional borings were drilled in the vicinity of the waste oil tank. The locations of the borings are shown on Figure 5. Boring B-5 was drilled 9 feet from the fence-line at the center of the tank, at an approximate angle of 3° from vertical toward the fence. The boring extended to a slant depth of 119.5 feet. Samples were collected approximately every 5 feet as subsurface conditions allowed. The boring was converted to a vadose zone well with 4-inch Schedule 40 PVC, and screened from 20 to 100 feet. The well was sand packed with #4 Monterey sand and sealed with 1/4-inch bentonite pellets and voclay grout.

Boring B-6 was drilled 12 feet northwest of B-5 at an approximate angle of 12° from vertical toward the fence. This boring was drilled to a depth of 86.5 feet. Samples were

collected every 5 feet as subsurface conditions allowed. This boring was also completed as a vadose zone well, with the screened interval from 20 to 70 feet and the well bottom at 70 feet.

Boring B-7 was drilled vertically, 20 feet southeast of B-5 to a depth of 100 feet. Samples were obtained at 5-foot intervals as subsurface conditions allowed. The boring was completed as a vadose zone well to a depth of 95 feet. The screened interval was from 20 to 95 feet. The vadose zone wells at B-6 and B-7 were constructed in the same manner as the well at B-5.

Boring B-8 was drilled vertically 15 feet southeast of B-7, to a depth of 50.8 feet. Samples were collected every 5 feet as subsurface conditions allowed. This boring was backfilled with Voclay grout.

Groundwater was not encountered during the drilling of these borings.

Samples were collected using a modified California type sampler using brass tubes. In general one brass tube from each sampling depth was sealed with PVC end caps and kept on ice until delivery to the chemical laboratory. Samples were labeled and were delivered to the laboratory under standard chain-of-custody procedures. Drilling equipment was steam cleaned prior to drilling of each boring. Sampling equipment was cleaned prior to use at each sampling point using Woodward-Clyde standard procedures. Field observations including soil type, color, consistency, odor, and headspace OVA readings were recorded on boring logs by Woodward-Clyde drilling supervisors. Boring logs are presented in Appendix B.

3.1 GEOLOGY

The boreholes P-4 and B-5 through B-8 penetrated generally dense, medium to coarse-grained, gravelly sands with cobbles up to 8 inches in diameter, from the surface to between 10 and 20 feet below ground surface. An interval of very dense silty sand with gravel and cobbles was encountered from approximately 10 to 30 feet below ground surface. Below this interval down to the maximum depth penetrated, very dense to dense, moist to very moist gravelly, medium to coarse-grained sands and coarse gravels were encountered. Cobbles up to 8 inches in diameter, and occasional large boulders were also encountered.

The subsurface materials encountered can be characterized as coarse-grained, highly variable and laterally discontinuous alluvial deposits. The absence of fine-grained deposits suggests that they were deposited in a high-energy environment, not far from their source in the mountains to the north.

3.2 ANALYTICAL RESULTS

The contents of the tank and selected soil samples collected during the drilling program were analyzed by West Coast Analytical Services, Inc. The original laboratory reports and chain-of-custody forms are included as Appendix C. The results are discussed in the following paragraphs.

3.2.1 Tank Contents

The tank contents were analyzed for petroleum hydrocarbons by modified EPA Method 8015 and metals by ICP. The analytical results from the sample of the tank contents are presented in Table 1. The sample contained >99 percent petroleum hydrocarbons (C_5-C_{30}), with some metals detected. The hydrocarbon range detected and the color seem to indicated the presence of waste oil in the tank.

3.2.2 Soil Samples

The soil samples collected during the investigation were subjected to a variety of analyses. Soil Samples 1X and 4X were analyzed by EPA Method 8015 to provide identification of the hydrocarbon species present. These results indicated the presence of C_{10} - C_{20} hydrocarbons in Sample 4X at concentrations of 430 mg/kg (see Table 2 for results). Additional samples collected from the first boring drilled near the tank (P-4) confirmed the presence of C_{10} - C_{20} hydrocarbons, but also indicated the presence of a C_{20} - C_{30} fraction as well (Table 3). The absence of elevated organic vapor analyzer readings was further evidence of the absence of volatile hydrocarbons, such as gasoline, in the soil.

Samples 3A-1 and 3A-2 which were collected from beneath the tank when it was removed, were analyzed for benzene, toluene, xylenes, and ethylbenzene (BTXE) by EPA Method 8020, as well as for total petroleum hydrocarbons (TPH) by Method 418.1. The results showed the presence of ethylbenzene, toluene and total xylenes in the samples. Not other compounds from the 8020 target list were detected (see Table 2).

The samples analyzed from borings B-5 through B-8 showed the presence of C_{10} - C_{20} and C_{20} - C_{30} hydrocarbons to a depth of approximately 100 feet in Boring B-5, 65 feet in Boring B-6 and approximately 90 feet in Boring B-7. The samples analyzed from Boring B-8 did not contain detectable petroleum hydrocarbons. The analytical results coupled with visual observations of the soil and organic vapor analyzer readings, show that the hydrocarbons with concentrations greater than 100 mg/kg extend to a depth of 95 to 100 feet nearest the location of the tank.

Selected samples from Boring B-5, B-6, and B-7 were also analyzed for volatile organic compounds by EPA Method 8240. With the exception of methylene chloride, which is a common laboratory contaminant that was also found in the laboratory blanks no chlorinated compounds were detected.

In order to evaluate whether the subsurface soil at the tank location might be hazardous the following tests were also performed on one sample each (Sample B-5-14-4 and B-6-9-4) from Borings 5 and 6.

- pH
- Flash point
- Aquatic toxicity
- Metals - 17 California Code of Regulations (CCR)
- Volatile organic compounds

The results are summarized in Table 4. None of the tests conducted indicated that the soil would be hazardous.

In addition to the two samples discussed above (B-5-14-4 and B-6-9-4), samples P-4-2-4 and B-7-6-4 were also analyzed for 17 CCR metals. The concentration of the metals were generally within the range found in soil the United States, with the exception of copper in sample P-4-2-4, which was present at a concentration of 547 mg/kg, outside the typical concentration range found in natural soil of 2 to 300 mg/kg. Appendix D contains a list of typical soil concentrations in the western United States. It should be noted that the concentration of copper in the other three samples was less than 45 mg/kg.

4.0
CONCLUSIONS

The petroleum hydrocarbon impacted soil at the locations evaluated extends to a vertical depth of 95 to 100 feet. The complete lateral extent of the hydrocarbon-impacted soil is not known but Boring B8 was outside the zone of impacted soil to the depth it was drilled. The hydrocarbons are primarily the C_{10} - C_{30} fraction, and no chlorinated hydrocarbons were detected in the samples analyzed by EPA Method 8240. The soil does not appear to be hazardous with respect to pH, flammability or aquatic toxicity, and metal concentrations are generally within the range typically found in soils, except for one sample from Boring P4 which contained copper at a concentration of 547 mg/kg. This concentration is greater than the general range of concentrations found in soil in the western United States (2 to 300 mg/kg).

5.0
LIMITATIONS

The investigation described in this report was designed to provide preliminary information on the vertical and lateral extent of petroleum hydrocarbons in the soil resulting from leakage from a waste oil tank.

The conclusions drawn are based solely on the results obtained from this investigation, and are subject to revision if additional investigative work is conducted.

LABORATORY REPORT

Samples Received: Six (6) Soil Samples
Date Received: 4-23-91
Purchase Order No: Proj#: 904W217A/UCP Remediation

The samples were analyzed as follows:

Samples Analyzed	Analysis	Results
Four (4) soils	Total Petroleum Hydrocarbons by EPA 418.1	Table 1
Two (2) soils	Fuel Hydrocarbons by Modified EPA 8015 (LUFT Manual, April 1989)	Table 2
Six (6) soils	Volatile Aromatics by EPA 8020	Data Sheets

Santa Ana, CA 92705

Attn: Dr. Alistaire Callender

JOB NO. 18333 A

LABORATORY REPORT

Samples Received: Four (4) soils and one (1) liquid product
Date Received: 4-16-91
Purchase Order No: Proj#: 904W217A-1000/UCP Remediation

The samples were analyzed as follows:

Samples Analyzed	Analysis	Results
Two (2) soils and one (1) liquid	Fuel Hydrocarbons by Modified EPA 8015 (LUFT Manual, April 1989)	Table 1
One (1) liquid product	CAM (17) Metals by ICPMS	Data Sheet

Data Reporting Qualifiers

Value - If the result is a value greater than or equal to the Detection Limit (DL), the value is reported.

ND - Indicates that the compound was analyzed for but not detected. The minimum DL for the sample with the ND is reported based on necessary concentration or dilution actions.

B - Indicates that the compound was found in the sample and the blank, and the value is reported without blank subtraction.

Attn: Dr. Alistaire Callender

JOB NO. 19234 A

LABORATORY REPORT

Samples Received: Fifteen (15) Soil Samples
Date Received: 8-16-91
Date Released for Analysis: 8-26-91
Purchase Order No: Proj#: 904W217A/UCP

The samples were analyzed as follows:

Samples Analyzed	Analysis	Results
Three (3) soils	Fuel Hydrocarbons by Modified EPA 8015 (LUFT Manual, April 1989)	Table 1
Three (3) soils	Total Petroleum Hydrocarbons by EPA 418.1	Table 2
One (1) soil	CAM (17) Metals by ICPMS	Data Sheet
Two (2) soils	Volatile Organics by EPA 8260	Data Sheets

Michael Shelton
Technical Director

CHLOROBENZENE	82-109	75-115	8	12

Data Reporting Qualifiers

Value - If the result is a value greater than or equal to the Detection Limit (DL), the value is reported.

ND - Indicates that the compound was analyzed for but not detected. The minimum DL for the sample with the ND is reported based on necessary concentration or dilution actions.

B - Indicates that the compound was found in the sample and the blank, and the value is reported without blank subtraction.

JOB NO. 19222 A

LABORATORY REPORT

Samples Received: Thirty (30) Soil Samples
Date Received: 8-15-91
Date Released for Analysis: 8-26-91
Purchase Order No: Proj#: 904W217A-3000/UCP

The samples were analyzed as follows:

Samples Analyzed	Analysis	Results
Four (4) soils	Fuel Hydrocarbons by Modified EPA 8015 (LUFT Manual, April 1989)	Table 1
Two (2) soils	Total Lead by ICPMS	Table 2
Six (6) soils	Total Petroleum Hydrocarbons by EPA 418.1	Table 3
Two (2) soils	pH by EPA 9040	Table 4
Two (2) soils	Flash Point by EPA 1010	Table 4

Data Reporting Qualifiers

Value - If the result is a value greater than or equal to the Detection Limit (DL), the value is reported.

ND - Indicates that the compound was analyzed for but not detected. The minimum DL for the sample with the ND is reported based on necessary concentration or dilution actions.

B - Indicates that the compound was found in the sample and the blank, and the value is reported without blank subtraction.

Atten: Waste Management Division

SUBJECT: TANK CLOSURE REPORT
FILE NUMBER 593, PERMIT NUMBER 7963

Dear Mr. Sjoberg:

On behalf of Mission-Koll I (Koll), Woodward-Clyde Consultants (Woodward-Clyde) is submitting this report regarding the removal of two underground storage tanks at 14041 East Live Oaks Avenue, Irwindale, California (Figure 1). This report addresses the items listed in the Los Angeles County Department of Public Works closure report checklist (Attachment A). The two tanks consisted of a 10,000 gallon steel (unleaded) gasoline tank and a 10,000 gallon double-walled fiberglass diesel tank. Figure 2 shows the locations of the tanks.

The tanks were removed on April 23, 1991 in accordance with conditions specified in permit number 7963, file number 593. The general contractor for the removal was J. D. Edwards at 11711 Clark Street, Unit 110, Arcadia, California 91006. They employed the following additional subcontractors:

- Nieto & Sons Trucking, Inc., Brea, California
  (cleaned tanks and hauled and disposed of liquid waste)

- CTL Environmental Services, Harbor City, California
  (Certified Industrial Hygienist)

- Western Tank Testing, 22911 Savi Ranch Parkway, Yorba Linda, California (Degassed fuel tank)

Woodward-Clyde personnel documented the removal of the tank and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. During the tank removal activities, the air in and around the tank excavation was monitored for volatile organics with an organic vapor analyzer (OVA). Most of the readings were near background (1.5 ppm) with two exceptions. Two readings were taken when a gasoline odor was noticed that registered > 100 ppm. These readings were obtained prior to tank de-gassing and seemed to be due to wind blowing

2020 East First Street • Suite 400 • Santa Ana, California 92705
(714) 835-6886 • (213) 581-7164 • FAX (714) 667-7147

the vapors from the tanks. The tanks were pumped, de-gassed and certified "clean" by a certified industrial hygienist, and were then transported to American Metal Recycling, Inc. 2202 South Milliken Avenue, Ontario, California for disposal. Documentation of the removal, certification, and proper disposal of the tanks is included in Attachment B.

Soil samples were collected beneath the ends of the tanks (at an approximate depth of 15 feet below grade) as specified in the removal permit. The samples were collected by using a backhoe to excavate soil from the desired depth, and then collecting a sample from the bucket of the backhoe, using a spatula. The samples were grab samples (no borings were drilled), and were collected within one half hour after the tanks were removed (between 2:15 and 2:45 pm). They were stored on ice and transported with chain-of-custody documentation to West Coast Analytical Services, Inc. for analysis for total petroleum hydrocarbons (TPH) and for volatile aromatic hydrocarbons by EPA Method 8020. The samples from beneath the gasoline tank were analyzed for TPH by EPA Method 8015 (modified), and the samples from beneath the diesel tank were analyzed for TPH by EPA Method 418.1. Laboratory reports and chain-of custody forms are included in Attachment C.

The analytical results revealed non-detect concentrations of TPH (detection limit of 10 mg/kg) for all samples except for sample 1B, collected beneath the north end of the diesel tank, which contained 186 mg/kg of TPH. Low concentrations of toluene, ethylbenzene and xylenes were detected in three of the four samples. These compounds were also detected in similar concentrations in the lab blanks, indicating that their presence was due to laboratory contamination.

Given the detection of TPH beneath the north end of the diesel tank, Woodward-Clyde personnel collected additional samples to assess the magnitude and extent of the TPH. On May 3 1991, samples were collected at the same location as sample 1B, but at greater depths (20 and 25 feet) below grade. These samples were collected as described above, and were transported with accompanying chain-of-custody documentation to West Coast Analytical Service, Inc. for analysis for TPH by EPA Method 418.1, and for volatile aromatic hydrocarbons by EPA Method 8020. Both samples were non-detect for TPH (detection limit of 10 mg/kg). Low levels of toluene and xylenes were detected in the samples as well as in the lab blank, and 2 ug/kg of ethylbenzene was detected in sample T-20B.

On May 9 1991, four additional samples were collected. Samples 1B-N1, 1B-S1, 1B-W1 and 1B-E1 were collected 2 to 5 feet north, south, west and east, respectively, of the original sample 1B. These samples were collected as described above, and were Los

transported with accompanying chain-of-custody documentation to West Coast Analytical Service for analysis for TPH by EPA Method 418.1, and for volatile aromatic hydrocarbons by EPA Method 8020. All of the samples were non-detect for the target compounds with the exception of sample 1B-W1 which contained 2 ug/kg of toluene.

The soil that was removed beneath the north end of the diesel tank to allow sample collection was stockpiled near the tank excavation. The estimated quantity of this soil is 3 cubic yards. On May 15 1991, when the excavation was backfilled, this soil was transported to another location on the site. This soil had no odor or discoloration. According to California LUFT guidelines, this soil will not require further treatment. We have since contacted personnel from both the Los Angeles County Department of Public Works-Waste Management Division and the California Regional Water Quality Control Board-Well Investigation Program who have both indicated that grading this soil back into the site would be acceptable.

CERTIFICATION

I have reviewed this report and declare that the information included herein is true and accurate and complete to the best of my knowledge.

CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 1460, Alhambra, CA 91802-1460, containing:

1. File number of facility and closure permit number.

2 Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.

3. Description of methods for obtaining, handling, and transporting samples.

4. Time and date samples were obtained.

5. If borings were established, boring logs certified by a CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

6. Chain-of-custody documentation initiated by person obtaining sample through person at State Department of Health Services certified laboratory.

7. Disposal destination of tanks and evidence of legal disposal.

8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

9. Documentation as to depth of groundwater at facility.

10. Manifests to document hazardous waste disposal of any removed soil and tank rinsate.

11. Any observations of site contamination.

12. Remedial action plan to mitigate contamination.

13. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

Certificate of Treatment/Recycling

ISSUED TO

United Conveyor Pipe

FOR

MANIFEST NUMBER 9032103-4 DATE RECEIVED 4-29-91

The aqueous waste received on the above manifest will be treated to standards mandated by the FEDERAL CLEAN WATER ACT and to effluent requirements established by the Sanitation Districts of Los Angeles County. Waste treatment and recycling is performed under permits granted to DeMENNO/KERDOON, a California corporation, by the California Department of Health Services, in coordination with the Environmental Protection Agency, in accordance with the provisions of the Resource Conservation and Recovery Act (RCRA) of 1976, together with applicable federal and state regulations including but not limited to waste discharge requirements established by the Sanitation Districts of Los Angeles County.

When the above described waste material is accepted by DeMENNO/KERDOON and treated/recycled and the aqueous phase discharged for further treatment by the Sanitation Districts, the certificate holder's responsibility for the waste material is eliminated under both RCRA and Proposition 65. Upon request, DeMENNO/KERDOON will issue this certificate that all waste material has been handled in accordance with applicable permits and the certificate holder's liability has been terminated.

DeMENNO/KERDOON

TANK NUMBER (if any): (1) 761278

RESULTS OF TANK INSPECTION: LEL 0% 12:30 4/23/91

The tank described above has been inspected and found to be gas free based on readings obtained with an MSA type 2A Explosivity Meter (LEL of zero percent). A visual inspection has been made of the interior of the tank and no visible contamination has been observed except as noted below:

EXCEPTION: NONE

The tank described above is approved for removal and transportation.

INSPECTED BY: _____ CERTIFIED BY: STUART E. SALOT, Ph.D., C.I.H.

SUBJECT: WORK PLAN TO CONDUCT REMEDIAL INVESTIGATION AT 14005 EAST LIVE OAK AVENUE, IRWINDALE, CALIFORNIA

Dear Ms. Taylor:

The accompanying document is being submitted on behalf of Hughes Markets, in response to your letter of March 31, 1992 concerning additional site investigation requested for the property at 14005 East Live Oak Avenue. This property was formerly part of 14041 East Live Oak Avenue, Irwindale, California.

A proposed remediation strategy is also presented in the document. We request that you review the document, and after your review we would like to meet with you to discuss any comments you might have. We hope this meeting can occur by May 31, 1992.

Please call the undersigned if you have questions.

Sincerely yours,

WOODWARD-CLYDE CONSULTANTS

Alistaire Callender, Ph.D.
Project Manager

Proposal No. 914W412P
May 18, 1992

1.0
INTRODUCTION AND BACKGROUND

The property located at 14005 East Live Oak in Irwindale, California (the site), is currently owned by Hughes Markets (Hughes). The site was formerly part of a 74-acre parcel owned, occupied, and operated by United Concrete Pipe (UCP). This property is located in the City of Irwindale, just east of the San Gabriel River channel and south of Santa Fe Dam (Figure 1). It is noted that the original 74-acre parcel had the address of 14041 East Live Oak Avenue.

In 1991, Mission Koll I purchased the 74-acre parcel from UCP. Mission Koll I then sold a portion of the parcel to the City of Irwindale, resulting in the two parcels shown on Figure 2. Mission Koll I subsequently subdivided its parcel as shown on Figure 3. The parcel section at 14005 East Live Oak was purchased by Hughes in March 1991.

During grading operations at the site in 1991, the grading contractor encountered an underground tank. The contents, age, and integrity of the tank were unknown. In April 1991, the tank was removed and samples of its contents were collected. Woodward-Clyde personnel observed the tank removal activities and collected soil samples from the tank excavation. The soil in the tank excavation (approximately 15 feet deep) appeared oil-stained. The stained soil appeared to extend below the excavation floor and beyond the northern excavation walls off site toward Arrow Highway.

To evaluate the vertical and lateral extent of oil-impacted soil, Woodward-Clyde drilled five borings (P-4, B-5, B-6, B-7, and B-8) in the vicinity of the former tank from May through August 1991. The approximate boring locations are shown on Figure 4; surveyed locations of the borings are shown on Plate 1 (Appendix A). The borings were drilled to depths ranging from approximately 50 feet to 120 feet. Borings B-5 and B-6

were slant-drilled, and the remainder were drilled vertically. Soil samples collected during drilling were delivered to West Coast Analytical Services, Inc. (WCAS), a state-certified laboratory, for chemical analysis.

Borings B-5, B-6, and B-7 were converted to vadose zone wells. The wells were constructed of 4-inch-diameter polyvinyl chloride (PVC) pipe with screened intervals of 20 to 100 feet, 20 to 70 feet, and 20 to 95 feet, respectively.

Observations made during drilling and soil sampling indicated that subsurface soils are coarse-grained alluvial deposits that are highly variable and laterally discontinuous. Coarse gravel, cobbles, and boulders were encountered in the borings drilled. Groundwater was not encountered in the boreholes at the time of drilling. (Groundwater in the vicinity of the site is reportedly present at a depth of 180 to 200 feet.)

The laboratory analysis of the samples collected from the tank contents detected over 99 percent petroleum hydrocarbons (C_5 - C_{30}). This range of hydrocarbons indicates that the tank contained waste oil.

Selected soil samples from the tank excavation and borings were analyzed for total recoverable petroleum hydrocarbons (TRPH) according to EPA Method 418.1; total petroleum hydrocarbons (TPH) according to modified EPA Method 8015; and the aromatic hydrocarbons benzene, toluene, ethylbenzene, and xylenes (BTEX) according to EPA Method 8020. Additionally, two samples (one each from Borings B-5 and B-6) were analyzed for pH (EPA Method 9045); flash point (EPA Method 1010); aquatic toxicity (fish bioassay procedures specified in Article 11, Title 22 of the California Code of Regulations [22 CCR]); the 17 toxic and bioaccumulative metals listed in 22 CCR (inductively coupled plasma-mass spectroscopy); and volatile organic compounds (EPA Method 8260). Two additional soil samples (one each from Borings P-4 and B-7) were also analyzed for CCR metals.

The analytical results indicated the presence of petroleum hydrocarbons to a vertical depth of 95 to 100 feet at the boring locations, with the exception of Boring B-8. To the total depth drilled, Boring B-8 appeared to be located outside the zone of impacted soil. The hydrocarbons detected were primarily in the C_{10} - C_{30} fraction, and no chlorinated hydrocarbons were detected in the soil samples analyzed by EPA Method 8260. The soil at the sampling locations does not appear to be hazardous with respect to pH, ignitability, or aquatic toxicity. One sample from Boring P-4 contained copper at a concentration of 547 mg/kg, which exceeds the general range of copper concentrations found in soil in the western United States (2 to 300 mg/kg).

Results of the investigation were documented in a December 1991 report entitled "Investigation of Waste Oil Tank at 14041 East Live Oak Avenue, Irwindale, California." (At the time the investigation was conducted, the address for the subject site was 14041 East Live Oak Avenue.) In February 1992, this report was submitted to the Los Angeles County Department of Public Works (LACDPW) UST Local Oversight Program. The LACDPW is the lead agency for this project.

A meeting was held on February 20, 1992, at which the status of the investigative program was discussed by Hughes and Woodward-Clyde with Ms. Yvonne Taylor of the LACDPW and Mr. Richard Kaumeyer of the California Regional Water Quality Control Board (CRWQCB). At the meeting, the overall status of the investigation was discussed, as well as potential remedial options. The LACDPW requested in a letter dated March 31, 1992 to Hughes (copy included in Appendix B) that a number of actions be implemented to complete the site evaluation. Specifically, the LACDPW requested that Hughes:

- Conduct additional drilling, soil sampling, and analysis to better evaluate the extent of oil-impacted soil at the site
- Prepare a plan for remediation of oil-impacted soil at the site.

The scope of work proposed by Woodward-Clyde to meet the LACDPW requirements and to develop data for remediation is presented in Section 2.0.

Hughes and Southern California Edison Company (SCE) are presently negotiating the disposition of the aboveground power lines that run approximately above the fence line parallel to Arrow Highway in the vicinity of the former tank area. The aboveground lines are to be removed and replaced with underground lines at an approximately 5-foot depth within the boundaries of the site (refer to Appendix A).

2.0
SCOPE OF WORK

The scope of work has been designed to satisfy the LACDPW requirements and to collect information for design of the remediation system. Possible remediation technologies have been reviewed based on previous discussion among Hughes, Woodward-Clyde, and the LACDPW, and on an assessment of site conditions. Because of the vertical extent of oil-impacted soil, the coarse-grained and highly variable subsurface materials, and the current and future site access limitations, bioremediation appears to be a practical and reasonable remediation technique.

The tasks described in the following paragraphs would meet the objectives of further investigating and evaluating the nature and extent of oil-impacted site soil, and developing a remedial program.

Task 1: Additional Drilling, Soil Sampling and Analysis, and Well Construction

Two borings (B-9 and B-10) will be drilled at the locations shown on Plate 1, Appendix A. These boring locations were selected to better evaluate the extent of oil-impacted soil southwest and northwest of the former tank location. If possible, a third boring will be drilled to the northeast of the original tank location, across Arrow Highway, to delineate the extent of the impacted soil to the northeast. The borings will be drilled to a depth of 100 to 125 feet using the air percussion technique. Soil samples will be collected at 10 feet below ground surface, and at 5-foot intervals thereafter where possible.

Woodward-Clyde proposes to convert two of the borings to vadose zone wells. The wells will be constructed of 4-inch-diameter PVC pipe. The screened section of the wells will cover the depth interval of oil-impacted soil, and will be backfilled with sand compatible with the screen slot size. The upper portion of the wells will be constructed of blank PVC pipe, and the annulus will be backfilled with cement/bentonite grout.

Selected soil samples collected during drilling will be analyzed for TRPH according to EPA Method 418.1. Three samples per boring will be selected for analysis for volatile organic compounds (VOCs) by EPA Method 8260 and polychlorinated biphenyls (PCBs) by EPA Method 8080.

Task 2: Vapor Extraction Pilot Test

The pilot test will consist of applying a vacuum on one vadose zone well and measuring the vacuum in the surrounding wells. The purpose of the pilot test is to provide information on the air flow characteristics of the unsaturated soil for design of the bioremediation system.

The pilot test will be conducted using a liquid-ring blower capable of a maximum flow of 130 cubic feet per minute and a maximum vacuum of 24 inches of mercury. The pilot test will be performed for a minimum of 4 hours. During the pilot test, Woodward-Clyde personnel will monitor the system flow rate, the wellhead vacuum, and the discharge vapor concentration from wells installed in the zone of impacted soil. By monitoring the flow at different vacuums, a flow rate versus vacuum curve will be developed. This curve will be used for sizing the blower used in the final system design.

Task 3: Bioremediation Bench-Scale Test

To evaluate the treatability of the oil-impacted soil by bioremediation, a bench-scale test will be conducted. The success of an in situ bioremediation system will depend on the presence of a population of acclimated microorganisms in the impacted zone and their ability to degrade the hydrocarbons present. A laboratory treatability study will be conducted at Centrum Laboratory in Redlands, California, using intact soil samples obtained from the zone of impacted soil. The treatability study will be designed by Woodward-Clyde, with input from Dr. William Frankenberger, University of California at Riverside.

Air will be passed through the soil at various flow rates, simulating the in situ bioremediation (bioventing) process. Concentrations of nitrogen and phosphorus will be added to the soil to evaluate if a nutrient deficiency exists. Measurements of carbon dioxide and oxygen in the air stream and hydrocarbon and microbial concentrations in the soil will be obtained over an anticipated 6-week period. The data will be used in selecting the optimal conditions for increased microbiological breakdown of the hydrocarbons by the bioventing process. The following parameters will be estimated from the treatability study:

- Population density of resident hydrocarbon-degrading microorganisms
- Stimulation of biodegradation of the hydrocarbons
- Expected concentrations of hydrocarbon vapors
- Estimated time to reach the targeted cleanup level.

The laboratory study may be supplemented with a field evaluation.

Task 4: Data Reduction/Bioremediation Treatment System Design

The remediation system will be designed on the basis of the results of Tasks 1 through 3. The treatment system would most likely be a combination of aboveground and in situ bioremediation. Considering planned site usage, the remediation program may generally be as follows:

- The uppermost 10 feet of oil-impacted soil would be excavated and transported to a land treatment unit (LTU), an area where the excavated soil would be spread, periodically disked, and moistened. Nutrients and/or bacteria may be added to enhance microbial degradation.
- Oil-impacted soil at depths greater than 10 feet would be treated by an in situ bioremediation system. Air would be extracted and/or injected through vadose zone wells, and gaseous nutrients may be added through the wells to enhance microbial degradation.

The proposed conceptual remedial program has been developed considering the following factors.

1. The petroleum hydrocarbons extend to a depth of approximately 90 feet, and appear to extend under an adjacent street. This means that remedial programs involving excavation and treatment are not feasible.

2. It will be necessary to evaluate whether in situ bioremediation can be implemented at the depths of concern at this site. It may not be possible to induce biological activity at the lower depths.

3.0
ESTIMATED SCHEDULE AND COSTS

The time to complete the scope of work described in Section 2.0 is estimated as follows:

Task 1 -	Mobilization	2 to 3 weeks
	Drilling, Sampling, and Well Construction	1 week
	Laboratory Analysis	2 weeks
Task 2 -	Vapor Extraction Pilot Test	1 week
Task 3 -	Bioremediation Bench-Scale Test	6 to 8 weeks
Task 4 -	Data Evaluation, Treatment System Design, and Report Preparation	3 weeks
	Total Estimated Timeframe	**15 to 18 weeks**

4.0
LIMITATIONS

This document and the information contained herein are the sole property of Hughes for use as Hughes sees fit. Professional judgments that have been made in preparing this work plan/proposal are based on evaluation of the technical information available and on our general experience in the environmental field in southern California.

The proposed investigation may not fully characterize the extent of oil-impacted soil on the Hughes site, and the proposed in situ bioremediation technique may not be completely effective. Because of the existence of SCE's aboveground power lines and the proximity of the Arrow Highway, evaluation of the lateral extent of contamination to the northeast of the site may not be possible. Therefore, the extent of oil-impacted soil to the northeast of the former tank may have to be estimated from the results of investigation on the accessible sides of the tank excavation. Additionally, the effectiveness of the potential in situ bioremediation may be difficult to evaluate in the future because of site conditions.

Los Angeles, CA 90065

Dear Mr. Parsoneault:

UST LOCAL OVERSIGHT PROGRAM REVIEW SHEET
INVESTIGATION OF WASTE OIL TANK AND TANK CLOSURE REPORT
PREPARED BY: WOODWARD-CLYDE CONSULTANTS
REPORTS DATED: DECEMBER 1991 AND JANUARY 14, 1992
CLOSURE PERMIT NO. 3058B
LOCATION: 14041 EAST LIVE OAK BOULEVARD, IRWINDALE

As discussed in our meeting on February 20, 1992 with Allstaire Callender of Woodward-Clyde and Richard Kaumeyer of the California Regional Water Quality Control Board, our agency is requesting additional investigation to further define the lateral limits of the petroleum contamination.

Although Boring B (drilled approximately 35 feet southeast of the tank) stepped out in the clean soil, the extent of contamination toward the northeast, southwest, and northwest remains undefined by laboratory analysis. Borings should step out into clean soil and encircle the plume.

It is understood that due to the underground utilities and the close proximity of Arrow Highway it would be difficult to drill toward the northeast. However, measures should be taken to determine the possibility of obtaining an encroachment permit to drill in the street.

Also, since it is uncertain as to the historical high groundwater level, it is advised that the investigation extend vertically to a minimum depth of 25 feet below the deepest detectable contamination. Selected soil samples should be analyzed for volatile organics and as mentioned by Richard Kaumeyer of the California Regional Water Quality Control Board soil test should be run for PCB's due to the presence of transformers on the site.

It was discussed that an in situ form of bioremediation is being considered, however, feasibility tests need to be conducted. We require that the State Department of Health Services, Office of Alternative Technologies be notified of this proposed remediation and their requirements be met prior to approval from our office. Please provide this agency with a workplan discussing the next phase of site investigation and remediation by April 30, 1992.

Notify Dave Lobato at (818) 458-4374 a minimum of 72 hours prior to commencing any significant investigation, remediation, or assessment activities on site. The Los Angeles County Department of Public Works may disregard the work performed if the County was not properly notified.

Correspondence should be submitted in duplicate to the Los Angeles County Department of Public Works, UST Local Oversight Program, Annex Building, P. O. Box 1460, Alhambra, CA 91802-1460.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

Very truly yours,

T. A. TIDEMANSON

WELL INVESTIGATION PROGRAM - FORMER WASTE OIL TANK AREA INVESTIGATION FOR HUGHES MARKETS PROPERTY AT 14005 LIVE OAK AVENUE, IRWINDALE, CA
(FILE NO. AB 108.1711)

→ new site address for new tank install

This letter is in response to our October 13, 1994 meeting during which closure of the former waste oil tank area at the subject site was discussed. A thorough review of the file revealed that your consultant, Woodward-Clyde Consultants, had submitted three reports pertaining to the investigation performed at the former waste oil tank area. These reports are:

1) Investigation of Waste Oil Tank Area at 14041 East Live Oak Avenue, Irwindale, California; dated December 1991.

2) Tank Closure Report for the Waste Oil Tank; dated January 23, 1992.

3) Report of Excavation, Hughes Markets Site; dated August 1992.

The following summaries and comments are based on the review of the above mentioned reports and the discussion as per our October 13, 1994 meeting.

GENERAL WASTE OIL TANK INFORMATION

1) A 2,000-gallon waste oil tank was removed on April 23, 1991 from the premise in accordance with Permit #8058B, File #593, issued by the County of Los Angeles Department of Public Works.

2) Laboratory analytical results of the tank contents using EPA Method 8015 indicated that over 99% were petroleum hydrocarbons (C5-C30).

SHALLOW SOIL SAMPLING RESULTS

After removal of the tank, soil samples 3A-1 and 3A-2 were collected approximately 3 feet below each end of the tank. Laboratory analytical results of the samples using EPA Method 8015 indicated the presence of ethylbenzene (up to 1.1 mg/kg), toluene (up to 0.37 mg/kg), and total xylenes (up to 22 mg/kg).

DEEP SOIL SAMPLING RESULTS

1) A total of five (5) deep borings, P-4, B-5, B-6, B-7, and B-8, were advanced in the vicinity of the former waste oil tank. Borings B-5 and B-6 were slant-drilled and the remainder were drilled vertically.

2) Laboratory analytical results of the soil samples obtained from the borings using EPA Method 418.1 indicated the presence of total petroleum hydrocarbons (TPH) with concentration levels up to 5,100 mg/kg at 85 feet below ground surface (bgs). However, the concentration levels reduced to 280 mg/kg at 97 feet bgs and to less than 10 mg/kg at 119 feet bgs.

3) No volatile organic compounds (VOCs) were detected in any of the soil samples using EPA Method 8260 except for methylene chloride (up to 140 µg/kg), which was also detected in the laboratory blank.

POST EXCAVATION CONFIRMATORY SAMPLING RESULTS

1) Excavation of the soil in the waste oil tank area was conducted on July 10, 1992 by Woodward-Clyde Consultants.

2) The depth of the excavation was approximately 10 feet below grade. The total length of the excavation was approximately 90 feet long. Approximately 850 cubic yards of soil were excavated.

3) Confirmatory soil samples were collected from the north-west and south-east of the excavation and analyzed for TPH by EPA Method 418.1.

4) The TPH concentration levels ranged from less than 5 mg/kg to 320 mg/kg, with five of the eight samples containing concentrations of TPH less than 100 mg/kg.

CONCLUSION

1) Groundwater elevation data obtained on July 11, 1994 from the monitoring well located at the J.H. Mitchell & Sons Distributors Inc. facility approximately 1/4 mile from the subject site indicated that the depth to groundwater was approximately 180 feet bgs.

2) Due to the low concentration levels (from 280 mg/kg to less than 10 mg/kg) of TPH detected in the deep subsurface (greater than 90 feet bgs) and the depth to groundwater in the vicinity of the subject site, Board staff conclude that the contamination detected in the former waste oil tank area does not present a significant threat to the underlying groundwater.

3) Based on the above findings, no further action is required of the subject facility regarding VOC and/or TPH contamination in the vadose zone **in the former waste oil tank area** with respect to this Regional Board's Well Investigation Program.

4) Additional investigation(s) may be required in other areas of the subject site to determine if the site is a threat to groundwater.

5) A copy of this letter will be forwarded to the County of Los Angeles Department of Public Works requesting their consideration of the final closure pertaining to Permit #8058B, File #593.

Please notify this Board of any change in your operation including storage and handling of chemicals or processing and disposal of waste with respect to the former waste oil tank area. It should also be noted that this letter in no way releases you from any chemical and/or waste handling requirements of this or any other agencies.

Should you have any questions, please contact David Koo at (213) 266-7540.

The objective of the upcoming soil boring investigation described in the attached work plan is to further investigate subsurface soil conditions and evaluate whether product from former underground storage tanks (USTs) had impacted deeper soil horizons beneath the site. It should be noted that, per our earlier discussions, this phase of work is being performed as part of a "due diligence" investigation for the property sale and title transfer and, as such, is proceeding without regulatory overview of the attached work plan. The scope of work, however, is intended to

LIST OF APPENDICES

A TASK CLOSURE REPORT (Dated December 20, 1991)

URS Corporation (URS) has been retained on behalf of TA Realty Associates and Ralphs Grocery Company to conduct a subsurface investigation at the former Hughes Market facility located at 14041 Live Oak Avenue. The proposed activities associated with this investigation are outlined below in this work plan. The activities are based on the results of an ongoing Phase I Environmental Site Assessment being conducted for the site as part of a "due diligence" evaluation prior to property sale and title transfer. The current property owner contact is identified as Mr. Tab Harrison of Ralphs Groceries. Mr. Harrison may be contacted by telephone at (310) 884-4083.

1.1 BACKGROUND

In 1991, URS was retained by Mission-Koll to decommission two 10,000-gallon steel underground storage tanks (USTs) at the former United Concrete Pipe (UCP) facility in Irwindale, California. The USTs consisted of a steel unleaded gasoline tank and a double-walled fiberglass diesel fuel tank. The tanks were removed in April 1991 under Closure Permit No. 7963B issued by the Los Angeles County Department of Public Works (LACDPW). A closure report was submitted to the LACDPW on December 20, 1991. A copy of the closure report (Woodward-Clyde Consultants, Tank Closure Report, December 20, 1991) can be found in Appendix A. LACDPW responded to the closure report with a letter dated March 1995 requesting additional sampling. There is no indication that the former owner has ever responded to this letter, or that a follow-up investigation was ever competed.

Hughes Markets acquired a portion of the property from Mission Koll and subsequently developed the property as a business office facility. A two-story office building was constructed over the location of the former USTs. Currently the office building is unoccupied pending sale of the property.

In July 2000, URS personnel met with Mr. Iheanacho Ofo of LACDPW to discuss the specific steps necessary to close the former USTs. In accordance with LACDPW guidelines, Mr. Ofo stated that further soil investigation including sampling for methyl-tertiary-butyl ether (MTBE) must be conducted before closure would be granted. The guidelines require five borings around the former UST cluster to depths of 40 feet below ground surface (bgs) (25 feet below the base of the UST invert) to assess the condition of the subsurface soil. Mr. Ofo stated that if no impacts from petroleum hydrocarbons were detected in the soil beneath the former tanks then LACDPW would consider granting UST closure.

1.2 OBJECTIVES

The objective of the investigation described in this work plan is to further investigate subsurface soil conditions to evaluate whether product from former USTs had impacted deeper soil horizons beneath the site. It should be noted that this phase of work is being performed as part of a "due diligence" investigation for a property sale and title transfer and, as such, is proceeding without regulatory overview of this work plan. The scope of work, however, is intended to fulfill guidelines presented by the LACDPW for a UST Site Assessment Plan with the objective of LACDPW to provide regulatory oversight for UST closure.

1.3 APPROACH

URS has proposed the following approach to meet the objective of the investigation:

- Perform tasks necessary to initiate field investigation
- Advance five soil borings to 40 bgs in the location of the former gasoline dispenser island and USTs to collect additional soil samples for analytical testing.
- Submit collected soil for appropriate analytical tests.
- Prepare a report describing the field activities and results of laboratory analyses.

1.4 SCOPE OF WORK

The scope of work necessary to meet the objective and approach of the investigation are outlined below, and described in detail in Sections 3 and 4.

1.4.1 Task 1: Preparation for Field Investigation Activities

Prior to conducting the subsurface investigation, URS will perform the following activities:

- Prepare/update the site-specific health and safety plan (HASP) for this phase of work.
- Notify Underground Service Alert of proposed investigation.
- Select construction, geophysics, concrete coring, drilling and analytical laboratory subcontractors.

1.4.2 Task 2: Field-Investigation Activities

The subsurface field investigation will include the following activities:

- Conduct site geophysical survey to verify utility clearances before beginning intrusive investigations.
- Supervise removal and re-construction of interior room walls by licensed contractor in order to provide access for drilling operations.
- Complete five hollow-stem auger borings to be advanced to 40 feet bgs.
- Collect soil samples at 5-foot intervals from the vadose zone during drilling of borings for soil classification, total organic vapor headspace measurements, and chemical analysis.
- Analyze the soil samples for total petroleum hydrocarbons (TPH - full carbon chain); benzene, toluene, ethylbenzene, and xylenes (BTEX); MTBE; and lead.

1.4.3 Task 3: Report Preparation

Following the field activities, URS will prepare a summary report with the investigation results and recommendations. In accordance with LACDPW guidelines, the report will include the following:

- Site information
- Facility maps
- Geology/Hydrogeology
- Boring logs
- Field sampling procedures
- Chain-of-custody records
- Laboratory results
- Waste management documentation
- Subsurface plume illustrations
- Conclusions and recommendations
- References

2.1 SITE DESCRIPTION

The former Hughes Market facility is located at 14005 East Live Oaks Avenue in Irwindale, California (Figure 1). The site was formerly part of a larger 74-acre parcel (14041 East live Oak Avenue) that was owned and occupied by United Concrete Pipe (UCP). Ralphs Markets acquired Hughes Markets and the property is now considered excess and is in the process of being sold.

The property is located east of the San Gabriel River Channel and south of the Santa Fe Dam. Rivergrade Road borders the subject property to the north-northwest, to the northeast by Arrow Highway, a vacant lot to the east and south by Live Oak Avenue (Figure 2). The property is developed with a 2-story vacant office building, asphalt parking lots, concrete sidewalks, and landscaped with grass, shrubs and trees.

2.1 GEOLOGY AND HYDROGEOLOGY

The site is situated in the north-central portion of the San Gabriel Valley Groundwater Basin, overlying fresh water-bearing deposits of that basin. The basin is an elongated, alluvium-filled valley extending from the central part of Los Angeles County almost to its eastern boundary. The valley is approximately 14 miles wide, and is bordered to the north by the San Gabriel Mountains and to the south by the Repetto, Puente, and the San Jose Hills. A topographic divide marks the eastern boundary of the basin, and the Raymond fault serves as the northwestern boundary. The surface area of the valley floor is approximately 100,000 acres.

Average annual precipitation in the site vicinity is approximately 14 inches, although rainfall to the north in the San Gabriel Mountains exceeds 35 inches annually. Because these mountains are composed primarily of non-water-bearing rock, local precipitation from the mountains runs off through the San Gabriel Canyon, providing sources of recharge to the water-bearing deposits underlying the valley floor in the vicinity of the site. The region's groundwater gradient from the mouth of the San Gabriel River is to the south and west.

The principal drainage in the area is the San Gabriel River, located west of the site. The riverbanks are lined with concrete. The river bottom consists of native alluvial sand and gravel deposits.

The surface deposits in the site are recent alluvium deposited in the San Gabriel River flood plain. These deposits overlie older alluvium. The central portion of the San Gabriel Valley Groundwater Basin has water-bearing deposits averaging about 1,000 feet in thickness. The

alluvium that comprises the water-bearing materials in the site vicinity consists of randomly sorted, subrounded to well-rounded, course-grained deposits derived from the San Gabriel Mountains to the north. The deposits range in size from silts to 4-foot diameter boulders. The alluvium generally consists of course sands and gravel, with occasional lenses of finer-grained material deposited during low-flow cycles.

The coarseness of the sands and gravel in the alluvial deposits makes these deposits very efficient aquifers. Horizontal permeability of the deposits range from about 100 to 500 gallons per day per square foot. Vertical permeability is generally an order of magnitude lower than the horizontal values.

Ground water levels in the vicinity of the site fluctuate greatly depending on the frequency and quantity of the precipitation. The existence of a perched water-bearing zone above the primary ground water basin at the site is unlikely, due to the coarse-grained nature of the soil.

2.2 SUMMARY OF PREVIOUS SITE INVESTIGATIONS

URS (formerly Woodward-Clyde) conducted a previous field investigation that consisted of the removal of two USTs at 14041 East Live Oaks Avenue in Irwindale, California. The field investigation was conducted on April 23, 1991. The two tanks consisted of a 10,000-gallon steel (unleaded) gasoline tank and a 10,000-gallon double-walled fiberglass diesel tank. A copy of the tank removal report can be found in Appendix A.

URS personnel documented the removal of the tanks and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. Soil samples were taken beneath the tanks at an approximate depth of 15 feet bgs as specified by the removal permit. Soil samples collected beneath the gasoline tank were analyzed for total petroleum hydrocarbons as gasoline (TPHg) by EPA Method 8015 Modified and the samples collected beneath the diesel tank were analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) by EPA Method 418.1.

The analytical results revealed non-detect concentrations of TPHg in samples collected beneath the unleaded gasoline tank. One sample collected beneath the north end of the diesel tank contained 186 milligrams per kilogram (mg/kg) of TRPH. Additional samples were then collected beneath the diesel tank to assess the magnitude and extent of the TRPH. On May 3, 1991, samples were collected at the same location the TRPH was detected but at greater depths (20 and 25 feet) below grade. The samples taken were non-detect for TRPH but showed low levels of toluene, xylenes, and ethylbenzenes.

On May 4, 1991, four additional samples were collected near the area were the original TRPH was detected. All samples were non-detect except for one sample that contained 2 micrograms per kilogram (ug/kg) of toluene. The soil removed beneath the tank for soil collection was stockpiled and later moved to another location on site in case further treatment was deemed necessary. The stockpiled soil was reported to show no sign of discoloration.

This section presents a discussion of pre-field activities to be conducted prior to beginning field investigation activities described in Section 4.0.

3.1 HEALTH AND SAFETY PLAN

A site-specific HASP will be prepared by URS prior to conducting field activities at the site. The HASP will describe specific health and safety requirements and guidelines for the proposed activities. In addition, URS employees and subcontractor employees assigned to the project will attend a tailgate safety meeting given by the Site Safety Officer each day that field activities are performed.

3.2 UNDERGROUND UTILITY SURVEY

Underground Service Alert will be notified at least 48 hours in advance of the proposed drilling activities. In addition, a geophysical survey will be conducted prior to performing subsurface work in order to identify the presence of potential utilities or underground structures. Four potential methods may be used: magnetic; electromagnetic; ground penetrating radar (GPR); or electromagnetic line location. Magnetics and electromagnetics are used to identify underground tanks, drums and conduits. These features are detected due the ferrous and electrically conductive material of their construction. GPR is used as a follow up technology to characterize identified magnetic or electromagnetic anomalies.

An area within an approximate 10-foot radius around the boring location will be surveyed. Once a proposed boring location is surveyed and cleared of utilities, the location will be remarked to denote clearance for drilling. If utilities are detected within the surveyed area, marking in paint on the ground will denote type of utility detected (e.g., electrical conduits) and the approximate location.

3.3 CONSTRUCTION ACTIVITY

Prior to initiating drilling activities a general contractor will remove appropriate building walls to provide access to for the drilling equipment to access the boring locations. URS will direct the contractor to the wall sections to be removed. Following completion of drilling activities the walls and utilities removed will be restored to original specifications.

This section presents a description of field activities to be performed during the site investigation.

4.1 SOIL BORING ADVANCEMENT

At each boring location, a concrete coring device equipped with a diamond-tipped circular concrete corer will be used to advance through the concrete surface.

Five borings (SB-1 through SB-5) will be advanced to a depth of 40 feet bgs or until refusal is met. The borings will be located in the area of the former dispenser island and USTs (Figure 3). Drilling of the borings will be performed using a hollow stem auger, limited space drilling rig with 6-inch outside diameter continuous-flight augers. Prior to drilling, boring locations will be hand-augured to approximately 5 feet bgs to verify that there are no underground utilities.

Soil samples will be collected at approximately 4-foot intervals beginning at 4-feet bgs and continuing to 40 feet bgs. The soil samples will be collected using a modified California split-spoon sampler, fitted with three brass liners. The sampler will be driven 18 inches (or to refusal) into undisturbed ground, by repeatedly dropping a 140-pound hammer from 30 inches above the sampler. The number of blows required to drive the sampler each 6 inches will be recorded. Refusal will be defined as requiring 50 hammer blows to advance the sampler 6 inches or less.

Soil samples will be used for measurement of head space volatile organic compound (VOC) concentration, describing the soil in accordance with the Unified Soil Classification System (USCS), and for chemical analysis (if selected).

Soil from the middle and top brass liners will be placed in a resealable plastic bag for approximately 15 minutes to allow VOCs in the soil to volatilize. The soil vapor will then be measured by inserting an organic vapor analyzer (OVA) or photoionization detector (PID) probe into the plastic bag. Background VOCs will be measured prior to each measurement. The organic vapor monitoring results will be recorded on boring logs.

The soil samples will be visually examined, described and classified in general accordance with the USCS. Soil descriptions will be recorded on the boring logs with other pertinent drilling notes.

The bottom brass liner from each sample interval will be sealed and capped, labeled, and stored in a chilled cooler for delivery to the laboratory.

A Registered Geologist or Professional Engineer experienced in environmental drilling and sampling will perform oversight of the drilling and sampling program. Boring logs will be prepared in accordance with the URS standard format for environmental drilling. At a minimum, boring logs shall contain geologic descriptions (USCS) of soil strata, depth to groundwater if encountered, depth to free product if present, sample identification numbers, blow counts, and OVA readings for headspace analyses. A Registered Geologist will review the boring logs.

During drilling activities, soil cuttings will be shoveled into 55-gallon drums. The drums will be labeled, identifying borings and depth intervals, and properly sealed or secured. Following a review of analytical soil tests the soil cuttings will be disposed at an appropriate licensed facility.

4.2 SOIL ANALYSIS

All soil samples collected from the borings will be submitted to Calscience Environmental Laboratories, Inc. (Calscience) in Garden Grove, California for analytical analyses. Soil samples collected 8, 16, 24, 32 and 40 feet will be analyzed for TPH analysis by EPA Method 8015-Modified for carbon chain to C44 and BTEX/MTBE using EPA Method 8020. Soil samples collected at 32 and 40 feet will be additionally analyzed for lead by EPA Method 6010B. Samples not selected for analysis (4, 12, 20, 28 and 36 feet) will be held by the laboratory in the event additional analysis is needed to confirm a "clean" zone beneath the former USTs. Samples showing detectable concentrations of MTBE will be confirmed by EPA Method 8260. All samples sent to the laboratory will be sealed, labeled, stored in a chilled cooler and submitted in accordance with EPA chain-of-custody field procedures. Soil samples will be analyzed by Calscience on a 24-hour turn around time. It should be noted that samples collected will not be analyzed for TRPH by EPA Method 418.1 since the former USTs did not contain motor oil.

4.3 DECONTAMINATION PROCEDURES

Drill rigs and augers will be decontaminated by steam cleaning at the drilling company's maintenance facility prior to arriving at the site. The drilling company will provide enough clean equipment for each day of drilling and sampling. They will also provide a mobile steam cleaner for field decontamination of augers, and other large equipment used for drilling and/or sampling. Only properly decontaminated equipment approved by URS Greiner Woodward Clyde onsite personnel will be used for drilling and sampling.

The field decontamination process for smaller (non-disposable) soil sampling equipment (i.e., split spoon sampler), will consist of wiping the equipment of excess soil, washing in a solution of

non-phosphate detergent (Liquinox), and rinsing with deionized water. The equipment will be cleaned prior to use, between each sample collection, and prior to leaving the site. All decontamination liquid and soil cuttings generated from drilling operations will be stored in 55-gallon Department of Transportation (DOT) approved drums, labeled, and properly sealed or secured. URS will stage the drums in an appropriate designated area for disposal.

4.4 QUALITY ASSURANCE SAMPLES

Laboratory QA/QC samples will be analyzed to identify the precision and accuracy of the laboratory measurements. Laboratory QA/QC samples consist of method blanks and matrix spike/matrix spike duplicates (MS/MSD) that are run daily as part of the laboratory's QA/QC plan. The purpose of the method blank samples is to evaluate the potential for introduction (during laboratory sample handling) of an analyte into a sample extract that is not present at detectable levels in the sample matrix. The purpose of the MS/MSD samples is to evaluate the effects of the sample matrix on the measurement methodology.

4.5 SAMPLE DOCUMENTATION AND TRACKING

Documentation of observations and data acquired in the field will provide information on the acquisition of samples and also provide a permanent record of field activities. The observations and data will be recorded with indelible ink in a permanently bound weatherproof field book with consecutively numbered pages and, if applicable, on field sampling data sheets.

The information in the field book will include the following as a minimum.

- Project name
- Location of sample
- Sampler's signature
- Date and time of sample collection
- Sample identification numbers and sample depth (if applicable)
- Description of samples (matrix sampled)
- Analysis to be performed
- Number and volume of samples
- Description of QA/QC samples (if collected)
- Sample methods

- Sample handling
- Field observations
- Personnel and equipment present

Changes or deletions in the field book should be lined out with a single strike mark, initialed and dated by person making change, and remain legible. Sufficient information should be recorded to allow the sampling event to be reconstructed without relying on the collector's memory.

URS will prepare a report of investigation following completion of field activities and laboratory analyses. The report will include a description of field activities, a summary of laboratory results in text and tabular format, conclusions and recommendations, site figures, boring logs, laboratory reports and chain-of-custody documentation, and QA/QC documentation.

2 Site Plan – Former Hughes Market Facility
3 Proposed Boring Locations – Former Hughes Market Facility

LIST OF APPENDICES

A TASK CLOSURE REPORT (Dated December 20, 1991)

URS Corporation (URS) has been retained on behalf of TA Realty Associates and Ralphs Grocery Company to conduct a subsurface investigation at the former Hughes Market facility located at 14041 Live Oak Avenue. The proposed activities associated with this investigation are outlined below in this work plan. The activities are based on the results of an ongoing Phase I Environmental Site Assessment being conducted for the site as part of a "due diligence" evaluation prior to property sale and title transfer. The current property owner contact is identified as Mr. Tab Harrison of Ralphs Groceries. Mr. Harrison may be contacted by telephone at (310) 884-4083.

1.1 BACKGROUND

In 1991, URS was retained by Mission-Koll to decommission two 10,000-gallon steel underground storage tanks (USTs) at the former United Concrete Pipe (UCP) facility in Irwindale, California. The USTs consisted of a steel unleaded gasoline tank and a double-walled fiberglass diesel fuel tank. The tanks were removed in April 1991 under Closure Permit No. 7963B issued by the Los Angeles County Department of Public Works (LACDPW). A closure report was submitted to the LACDPW on December 20, 1991. A copy of the closure report (Woodward-Clyde Consultants, Tank Closure Report, December 20, 1991) can be found in Appendix A. LACDPW responded to the closure report with a letter dated March 1995 requesting additional sampling. There is no indication that the former owner has ever responded to this letter, or that a follow-up investigation was ever competed.

Hughes Markets acquired a portion of the property from Mission Koll and subsequently developed the property as a business office facility. A two-story office building was constructed over the location of the former USTs. Currently the office building is unoccupied pending sale of the property.

In July 2000, URS personnel met with Mr. Iheanacho Ofo of LACDPW to discuss the specific steps necessary to close the former USTs. In accordance with LACDPW guidelines, Mr. Ofo stated that further soil investigation including sampling for methyl-tertiary-butyl ether (MTBE) must be conducted before closure would be granted. The guidelines require five borings around the former UST cluster to depths of 40 feet below ground surface (bgs) (25 feet below the base of the UST invert) to assess the condition of the subsurface soil. Mr. Ofo stated that if no impacts from petroleum hydrocarbons were detected in the soil beneath the former tanks then LACDPW would consider granting UST closure.

1.2 OBJECTIVES

The objective of the investigation described in this work plan is to further investigate subsurface soil conditions to evaluate whether product from former USTs had impacted deeper soil horizons beneath the site. It should be noted that this phase of work is being performed as part of a "due diligence" investigation for a property sale and title transfer and, as such, is proceeding without regulatory overview of this work plan. The scope of work, however, is intended to fulfill guidelines presented by the LACDPW for a UST Site Assessment Plan with the objective of LACDPW to provide regulatory oversight for UST closure.

1.3 APPROACH

URS has proposed the following approach to meet the objective of the investigation:

- Perform tasks necessary to initiate field investigation
- Advance five soil borings to 40 bgs in the location of the former gasoline dispenser island and USTs to collect additional soil samples for analytical testing.
- Submit collected soil for appropriate analytical tests.
- Prepare a report describing the field activities and results of laboratory analyses.

1.4 SCOPE OF WORK

The scope of work necessary to meet the objective and approach of the investigation are outlined below, and described in detail in Sections 3 and 4.

1.4.1 Task 1: Preparation for Field Investigation Activities

Prior to conducting the subsurface investigation, URS will perform the following activities:

- Prepare/update the site-specific health and safety plan (HASP) for this phase of work.
- Notify Underground Service Alert of proposed investigation.
- Select construction, geophysics, concrete coring, drilling and analytical laboratory subcontractors.

1.4.2 Task 2: Field-Investigation Activities

The subsurface field investigation will include the following activities:

- Conduct site geophysical survey to verify utility clearances before beginning intrusive investigations.
- Supervise removal and re-construction of interior room walls by licensed contractor in order to provide access for drilling operations.
- Complete five hollow-stem auger borings to be advanced to 40 feet bgs.
- Collect soil samples at 5-foot intervals from the vadose zone during drilling of borings for soil classification, total organic vapor headspace measurements, and chemical analysis.
- Analyze the soil samples for total petroleum hydrocarbons (TPH - full carbon chain); benzene, toluene, ethylbenzene, and xylenes (BTEX); MTBE; and lead.

1.4.3 Task 3: Report Preparation

Following the field activities, URS will prepare a summary report with the investigation results and recommendations. In accordance with LACDPW guidelines, the report will include the following:

- Site information
- Facility maps
- Geology/Hydrogeology
- Boring logs
- Field sampling procedures
- Chain-of-custody records
- Laboratory results
- Waste management documentation
- Subsurface plume illustrations
- Conclusions and recommendations
- References

2.1 SITE DESCRIPTION

The former Hughes Market facility is located at 14005 East Live Oaks Avenue in Irwindale, California (Figure 1). The site was formerly part of a larger 74-acre parcel (14041 East live Oak Avenue) that was owned and occupied by United Concrete Pipe (UCP). Ralphs Markets acquired Hughes Markets and the property is now considered excess and is in the process of being sold.

The property is located east of the San Gabriel River Channel and south of the Santa Fe Dam. Rivergrade Road borders the subject property to the north-northwest, to the northeast by Arrow Highway, a vacant lot to the east and south by Live Oak Avenue (Figure 2). The property is developed with a 2-story vacant office building, asphalt parking lots, concrete sidewalks, and landscaped with grass, shrubs and trees.

2.1 GEOLOGY AND HYDROGEOLOGY

The site is situated in the north-central portion of the San Gabriel Valley Groundwater Basin, overlying fresh water-bearing deposits of that basin. The basin is an elongated, alluvium-filled valley extending from the central part of Los Angeles County almost to its eastern boundary. The valley is approximately 14 miles wide, and is bordered to the north by the San Gabriel Mountains and to the south by the Repetto, Puente, and the San Jose Hills. A topographic divide marks the eastern boundary of the basin, and the Raymond fault serves as the northwestern boundary. The surface area of the valley floor is approximately 100,000 acres.

Average annual precipitation in the site vicinity is approximately 14 inches, although rainfall to the north in the San Gabriel Mountains exceeds 35 inches annually. Because these mountains are composed primarily of non-water-bearing rock, local precipitation from the mountains runs off through the San Gabriel Canyon, providing sources of recharge to the water-bearing deposits underlying the valley floor in the vicinity of the site. The region's groundwater gradient from the mouth of the San Gabriel River is to the south and west.

The principal drainage in the area is the San Gabriel River, located west of the site. The riverbanks are lined with concrete. The river bottom consists of native alluvial sand and gravel deposits.

The surface deposits in the site are recent alluvium deposited in the San Gabriel River flood plain. These deposits overlie older alluvium. The central portion of the San Gabriel Valley Groundwater Basin has water-bearing deposits averaging about 1,000 feet in thickness. The

alluvium that comprises the water-bearing materials in the site vicinity consists of randomly sorted, subrounded to well-rounded, course-grained deposits derived from the San Gabriel Mountains to the north. The deposits range in size from silts to 4-foot diameter boulders. The alluvium generally consists of course sands and gravel, with occasional lenses of finer-grained material deposited during low-flow cycles.

The coarseness of the sands and gravel in the alluvial deposits makes these deposits very efficient aquifers. Horizontal permeability of the deposits range from about 100 to 500 gallons per day per square foot. Vertical permeability is generally an order of magnitude lower than the horizontal values.

Ground water levels in the vicinity of the site fluctuate greatly depending on the frequency and quantity of the precipitation. The existence of a perched water-bearing zone above the primary ground water basin at the site is unlikely, due to the coarse-grained nature of the soil.

2.2 SUMMARY OF PREVIOUS SITE INVESTIGATIONS

URS (formerly Woodward-Clyde) conducted a previous field investigation that consisted of the removal of two USTs at 14041 East Live Oaks Avenue in Irwindale, California. The field investigation was conducted on April 23, 1991. The two tanks consisted of a 10,000-gallon steel (unleaded) gasoline tank and a 10,000-gallon double-walled fiberglass diesel tank. A copy of the tank removal report can be found in Appendix A.

URS personnel documented the removal of the tanks and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. Soil samples were taken beneath the tanks at an approximate depth of 15 feet bgs as specified by the removal permit. Soil samples collected beneath the gasoline tank were analyzed for total petroleum hydrocarbons as gasoline (TPHg) by EPA Method 8015 Modified and the samples collected beneath the diesel tank were analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) by EPA Method 418.1.

The analytical results revealed non-detect concentrations of TPHg in samples collected beneath the unleaded gasoline tank. One sample collected beneath the north end of the diesel tank contained 186 milligrams per kilogram (mg/kg) of TRPH. Additional samples were then collected beneath the diesel tank to assess the magnitude and extent of the TRPH. On May 3, 1991, samples were collected at the same location the TRPH was detected but at greater depths (20 and 25 feet) below grade. The samples taken were non-detect for TRPH but showed low levels of toluene, xylenes, and ethylbenzenes.

On May 4, 1991, four additional samples were collected near the area were the original TRPH was detected. All samples were non-detect except for one sample that contained 2 micrograms per kilogram (ug/kg) of toluene. The soil removed beneath the tank for soil collection was stockpiled and later moved to another location on site in case further treatment was deemed necessary. The stockpiled soil was reported to show no sign of discoloration.

This section presents a discussion of pre-field activities to be conducted prior to beginning field investigation activities described in Section 4.0.

3.1 HEALTH AND SAFETY PLAN

A site-specific HASP will be prepared by URS prior to conducting field activities at the site. The HASP will describe specific health and safety requirements and guidelines for the proposed activities. In addition, URS employees and subcontractor employees assigned to the project will attend a tailgate safety meeting given by the Site Safety Officer each day that field activities are performed.

3.2 UNDERGROUND UTILITY SURVEY

Underground Service Alert will be notified at least 48 hours in advance of the proposed drilling activities. In addition, a geophysical survey will be conducted prior to performing subsurface work in order to identify the presence of potential utilities or underground structures. Four potential methods may be used: magnetic; electromagnetic; ground penetrating radar (GPR); or electromagnetic line location. Magnetics and electromagnetics are used to identify underground tanks, drums and conduits. These features are detected due the ferrous and electrically conductive material of their construction. GPR is used as a follow up technology to characterize identified magnetic or electromagnetic anomalies.

An area within an approximate 10-foot radius around the boring location will be surveyed. Once a proposed boring location is surveyed and cleared of utilities, the location will be remarked to denote clearance for drilling. If utilities are detected within the surveyed area, marking in paint on the ground will denote type of utility detected (e.g., electrical conduits) and the approximate location.

3.3 CONSTRUCTION ACTIVITY

Prior to initiating drilling activities a general contractor will remove appropriate building walls to provide access to for the drilling equipment to access the boring locations. URS will direct the contractor to the wall sections to be removed. Following completion of drilling activities the walls and utilities removed will be restored to original specifications.

This section presents a description of field activities to be performed during the site investigation.

4.1 SOIL BORING ADVANCEMENT

At each boring location, a concrete coring device equipped with a diamond-tipped circular concrete corer will be used to advance through the concrete surface.

Five borings (SB-1 through SB-5) will be advanced to a depth of 40 feet bgs or until refusal is met. The borings will be located in the area of the former dispenser island and USTs (Figure 3). Drilling of the borings will be performed using a hollow stem auger, limited space drilling rig with 6-inch outside diameter continuous-flight augers. Prior to drilling, boring locations will be hand-augured to approximately 5 feet bgs to verify that there are no underground utilities.

Soil samples will be collected at approximately 4-foot intervals beginning at 4-feet bgs and continuing to 40 feet bgs. The soil samples will be collected using a modified California split-spoon sampler, fitted with three brass liners. The sampler will be driven 18 inches (or to refusal) into undisturbed ground, by repeatedly dropping a 140-pound hammer from 30 inches above the sampler. The number of blows required to drive the sampler each 6 inches will be recorded. Refusal will be defined as requiring 50 hammer blows to advance the sampler 6 inches or less.

Soil samples will be used for measurement of head space volatile organic compound (VOC) concentration, describing the soil in accordance with the Unified Soil Classification System (USCS), and for chemical analysis (if selected).

Soil from the middle and top brass liners will be placed in a resealable plastic bag for approximately 15 minutes to allow VOCs in the soil to volatilize. The soil vapor will then be measured by inserting an organic vapor analyzer (OVA) or photoionization detector (PID) probe into the plastic bag. Background VOCs will be measured prior to each measurement. The organic vapor monitoring results will be recorded on boring logs.

The soil samples will be visually examined, described and classified in general accordance with the USCS. Soil descriptions will be recorded on the boring logs with other pertinent drilling notes.

The bottom brass liner from each sample interval will be sealed and capped, labeled, and stored in a chilled cooler for delivery to the laboratory.

A Registered Geologist or Professional Engineer experienced in environmental drilling and sampling will perform oversight of the drilling and sampling program. Boring logs will be prepared in accordance with the URS standard format for environmental drilling. At a minimum, boring logs shall contain geologic descriptions (USCS) of soil strata, depth to groundwater if encountered, depth to free product if present, sample identification numbers, blow counts, and OVA readings for headspace analyses. A Registered Geologist will review the boring logs.

During drilling activities, soil cuttings will be shoveled into 55-gallon drums. The drums will be labeled, identifying borings and depth intervals, and properly sealed or secured. Following a review of analytical soil tests the soil cuttings will be disposed at an appropriate licensed facility.

4.2 SOIL ANALYSIS

All soil samples collected from the borings will be submitted to Calscience Environmental Laboratories, Inc. (Calscience) in Garden Grove, California for analytical analyses. Soil samples collected 8, 16, 24, 32 and 40 feet will be analyzed for TPH analysis by EPA Method 8015-Modified for carbon chain to C44 and BTEX/MTBE using EPA Method 8020. Soil samples collected at 32 and 40 feet will be additionally analyzed for lead by EPA Method 6010B. Samples not selected for analysis (4, 12, 20, 28 and 36 feet) will be held by the laboratory in the event additional analysis is needed to confirm a "clean" zone beneath the former USTs. Samples showing detectable concentrations of MTBE will be confirmed by EPA Method 8260. All samples sent to the laboratory will be sealed, labeled, stored in a chilled cooler and submitted in accordance with EPA chain-of-custody field procedures. Soil samples will be analyzed by Calscience on a 24-hour turn around time. It should be noted that samples collected will not be analyzed for TRPH by EPA Method 418.1 since the former USTs did not contain motor oil.

4.3 DECONTAMINATION PROCEDURES

Drill rigs and augers will be decontaminated by steam cleaning at the drilling company's maintenance facility prior to arriving at the site. The drilling company will provide enough clean equipment for each day of drilling and sampling. They will also provide a mobile steam cleaner for field decontamination of augers, and other large equipment used for drilling and/or sampling. Only properly decontaminated equipment approved by URS Greiner Woodward Clyde onsite personnel will be used for drilling and sampling.

The field decontamination process for smaller (non-disposable) soil sampling equipment (i.e., split spoon sampler), will consist of wiping the equipment of excess soil, washing in a solution of

non-phosphate detergent (Liquinox), and rinsing with deionized water. The equipment will be cleaned prior to use, between each sample collection, and prior to leaving the site. All decontamination liquid and soil cuttings generated from drilling operations will be stored in 55-gallon Department of Transportation (DOT) approved drums, labeled, and properly sealed or secured. URS will stage the drums in an appropriate designated area for disposal.

4.4 QUALITY ASSURANCE SAMPLES

Laboratory QA/QC samples will be analyzed to identify the precision and accuracy of the laboratory measurements. Laboratory QA/QC samples consist of method blanks and matrix spike/matrix spike duplicates (MS/MSD) that are run daily as part of the laboratory's QA/QC plan. The purpose of the method blank samples is to evaluate the potential for introduction (during laboratory sample handling) of an analyte into a sample extract that is not present at detectable levels in the sample matrix. The purpose of the MS/MSD samples is to evaluate the effects of the sample matrix on the measurement methodology.

4.5 SAMPLE DOCUMENTATION AND TRACKING

Documentation of observations and data acquired in the field will provide information on the acquisition of samples and also provide a permanent record of field activities. The observations and data will be recorded with indelible ink in a permanently bound weatherproof field book with consecutively numbered pages and, if applicable, on field sampling data sheets.

The information in the field book will include the following as a minimum.

- Project name
- Location of sample
- Sampler's signature
- Date and time of sample collection
- Sample identification numbers and sample depth (if applicable)
- Description of samples (matrix sampled)
- Analysis to be performed
- Number and volume of samples
- Description of QA/QC samples (if collected)
- Sample methods

- Sample handling
- Field observations
- Personnel and equipment present

Changes or deletions in the field book should be lined out with a single strike mark, initialed and dated by person making change, and remain legible. Sufficient information should be recorded to allow the sampling event to be reconstructed without relying on the collector's memory.

URS will prepare a report of investigation following completion of field activities and laboratory analyses. The report will include a description of field activities, a summary of laboratory results in text and tabular format, conclusions and recommendations, site figures, boring logs, laboratory reports and chain-of-custody documentation, and QA/QC documentation.

SUBJECT: TANK CLOSURE REPORT
FILE NUMBER 593, PERMIT NUMBER 7963

Dear Mr. Sjoberg,

On behalf of Mission-Koll I (Koll), Woodward-Clyde Consultants (Woodward-Clyde) is submitting this report regarding the removal of two underground storage tanks at 14041 East Live Oaks Avenue, Irwindale, California (Figure 1). This report addresses the items listed in the Los Angeles County Department of Public Works closure report checklist (Attachment A). The two tanks consisted of a 10,000 gallon steel (unleaded) gasoline tank and a 10,000 gallon double-walled fiberglass diesel tank. Figure 2 shows the locations of the tanks.

The tanks were removed on April 23, 1991 in accordance with conditions specified in permit number 7963, file number 593. The general contractor for the removal was J. D. Edwards at 11711 Clark Street, Unit 110, Arcadia, California 91006. They employed the following additional subcontractors:

- Nieto & Sons Trucking, Inc., Brea, California
  (cleaned tanks and hauled and disposed of liquid waste)
- CTL Environmental Services, Harbor City, California
  (Certified Industrial Hygienist)
- Western Tank Testing, 22911 Savi Ranch Parkway, Yorba Linda, California (Degassed fuel tank)

Woodward-Clyde personnel documented the removal of the tank and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. During the tank removal activities, the air in and around the tank excavation was monitored for volatile organics with an organic vapor analyzer (OVA). Most of the readings were near background (1.5 ppm) with two exceptions. Two readings were taken when a gasoline odor was noticed that registered > 100 ppm. These readings were obtained prior to tank de-gassing and seemed to be due to wind blowing

the vapors from the tanks. The tanks were pumped, de-gassed and certified "clean" by a certified industrial hygienist, and were then transported to American Metal Recycling, Inc. 2202 South Milliken Avenue, Ontario, California for disposal. Documentation of the removal, certification, and proper disposal of the tanks is included in Attachment B.

Soil samples were collected beneath the ends of the tanks (at an approximate depth of 15 feet below grade) as specified in the removal permit. The samples were collected by using a backhoe to excavate soil from the desired depth, and then collecting a sample from the bucket of the backhoe, using a spatula. The samples were grab samples (no borings were drilled), and were collected within one half hour after the tanks were removed (between 2:15 and 2:45 pm). They were stored on ice and transported with chain-of-custody documentation to West Coast Analytical Services, Inc. for analysis for total petroleum hydrocarbons (TPH) and for volatile aromatic hydrocarbons by EPA Method 8020. The samples from beneath the gasoline tank were analyzed for TPH by EPA Method 8015 (modified), and the samples from beneath the diesel tank were analyzed for TPH by EPA Method 418.1. Laboratory reports and chain-of custody forms are included in Attachment C.

The analytical results revealed non-detect concentrations of TPH for all samples except for sample 1B, collected beneath the north end of the diesel tank, which contained 186 mg/kg of TPH. Low concentrations of toluene, ethylbenzene and xylenes were detected in three of the four samples. These compounds were also detected in similar concentrations in the lab blanks, indicating that their presence was due to laboratory contamination.

Given the detection of TPH beneath the north end of the diesel tank, Woodward-Clyde personnel collected additional samples to assess the magnitude and extent of the TPH. On May 3 1991, samples were collected at the same location as sample 1B, but at greater depths (20 and 25 feet) below grade. These samples were collected as described above, and were transported with accompanying chain-of-custody documentation to West Coast Analytical Service, Inc. for analysis for TPH by EPA Method 418.1, and for volatile aromatic hydrocarbons by EPA Method 8020. Both samples were non-detect for TPH. Low levels of toluene and xylenes were detected in the samples as well as in the lab blank, and 2 ug/kg of ethylbenzene was detected in sample T-20B.

On May 9 1991, four additional samples were collected. Samples 1B-N1, 1B-S1, 1B-W1 and 1B-E1 were collected 2 to 5 feet north, south, west and east, respectively, of the original sample 1B. These samples were collected as described above, and were transported with accompanying chain-of-custody documentation to West Coast Analytical Service for analysis for TPH by EPA Method 418.1, and for volatile aromatic hydrocarbons by EPA Method 8020. All of the samples were non-detect for the target compounds with the exception of sample 1B-W1 which contained 2 ug/kg of toluene.

The soil that was removed beneath the north end of the diesel tank for sample collection was stockpiled near the tank excavation. On May 15 1991, when the excavation was backfilled, this soil was transported to another location on the site in case further treatment was deemed necessary. This soil had no odor or discoloration.

CERTIFICATION

I have reviewed this report and declare that the information included herein is true and accurate and complete to the best of my knowledge.

CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 1460, Alhambra, CA 91802-1460, containing:

1. File number of facility and closure permit number.
2. Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.
3. Description of methods for obtaining, handling, and transporting samples.
4. Time and date samples were obtained.
5. If borings were established, boring logs certified by a CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.
6. Chain-of-custody documentation initiated by person obtaining sample through person at State Department of Health Services certified laboratory.
7. Disposal destination of tanks and evidence of legal disposal.
8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.
9. Documentation as to depth of groundwater at facility.
10. Manifests to document hazardous waste disposal of any removed soil and tank rinsate.
11. Any observations of site contamination.
12. Remedial action plan to mitigate contamination.
13. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

16. GENERATOR'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway according to applicable international and national government regulations.

If I am a large quantity generator, I certify that I have a program in place to reduce the volume and toxicity of waste generated to the degree I have determined to be economically practicable and that I have selected the practicable method of treatment, storage, or disposal currently available to me which minimizes the present and future threat to human health and the environment; OR, if I am a small quantity generator, I have made a good faith effort to minimize my waste generation and select the best waste management method that is available to me and that I can afford.

Certificate of Treatment/Recycling

ISSUED TO

United Conveyed Pipe

FOR

MANIFEST NUMBER 20321034 DATE RECEIVED 4-29-91

The aqueous waste received on the above manifest will be treated to standards mandated by the FEDERAL CLEAN WATER ACT and to effluent requirements established by the Sanitation Districts of Los Angeles County. Waste treatment and recycling is performed under permits granted to DeMENNO/KERDOON, a California corporation, by the California Department of Health Services, in coordination with the Environmental Protection Agency, in accordance with the provisions of the Resource Conservation and Recovery Act (RCRA) of 1976, together with applicable federal and state regulations including but not limited to waste discharge requirements established by the Sanitation Districts of Los Angeles County.

When the above described waste material is accepted by DeMENNO/KERDOON and treated/recycled and the aqueous phase discharged for further treatment by the Sanitation Districts, the certificate holder's responsibility for the waste material is eliminated under both RCRA and Proposition 65. Upon request, DeMENNO/KERDOON will issue this certificate that all waste material has been handled in accordance with applicable permits and the certificate holder's liability has been terminated.

DeMENNO/KERDOON

EP-1

~~023305-032523~~
000590 -- 000593

Sept 26
~~August 2~~, 2000

Dear Mr. ~~Orban~~:

HAZARDOUS MATERIALS UNDERGROUND STORAGE
SITE INVESTIGATION PROPOSAL AND/OR REMEDIAL ACTION PLAN
FACILITY AT: ~~16102 GLADSTONE ST.~~, IRWINDALE (3S)
14041 E. LIVE OAK AVE.,

The revised site investigation proposal and/or remedial action plan dated ~~July 26,~~ Aug 10, 2000, for the above facility has been reviewed by this office and found adequate. You may proceed with the plan as proposed unless otherwise indicated below.

You are cautioned that any contaminated soils or hazardous materials generated during the approved operation must be manifested and transported to a hazardous waste disposal facility as required by California Health and Safety Code, Division 20, Chapter 6.5, unless evidence is presented indicating that the materials may be disposed of at a less restricted facility. Copies of all completed manifests shall be submitted to this office as part of the final report.

[ ] A Hazardous Waste Facility Permit or a Variance from permit requirements must be obtained from the State Department of Health Services and copies submitted to this office before commencing the proposed remedial action.

[X] NOTE: Sample for TPHD/BTEX/MTBE/TRPH at 10' intervals using 8015(m), 8020 and 418.1. Drill four borings to 40' bgs each, two at former tank area and two at former mechanic's work pit; with at least one slant boring at each location. Additionally, provide $247.00, for added review of pit area.

A written report containing the required information must be submitted to this office by August 31, 2000.

If you have any questions regarding this matter, please contact Mr. Iheanacho Ofo of this office at (626) 458-3512, Monday through Thursday, 7:00 a.m. to 5:30 p.m.

Very truly yours,

HARRY W. STONE

HAZARDOUS MATERIALS UNDERGROUND STORAGE
CLOSURE CERTIFICATION
CLOSURE APPLICATION NO. 7963B
FACILITY LOCATED AT 14005 EAST LIVE OAK AVENUE, IRWINDALE (3S)

C456727

This letter confirms the completion of a site investigation and corrective action for the underground storage tank(s) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank(s) are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, this agency finds that the site investigation and corrective action carried out at your underground storage tank(s) site is in compliance with the requirements of subdivisions (a) and (b) of Section 25296.10 of the California Health and Safety Code and with corrective action regulations adopted pursuant to Section 25299.3 of the California Health and Safety Code and that no further action related to the petroleum release(s) at the site is required.

This notice is issued pursuant to subdivision (g) of Section 25296.10 of the California Health and Safety Code.

If you have any questions, please contact Mr. Iheanacho Ofo, of this office, at (626) 458-3512, Monday through Thursday, 7 a.m. to 5:30 p.m.

Very truly yours,

DONALD L. WOLFE

INSTRUCTIONS

HAZARDOUS MATERIALS UNDERGROUND STORAGE PERMIT (HMUSP)
PERMIT APPLICATION SUPPLEMENT

DO NOT USE THIS FORM FOR CLOSURE, TRANSFER OR RENEWAL OF AN EXISTING HMUSP

(A) Facility name, mailing address and facility address on new permit applications must correspond with information on Part II of the State Permit Application (SPA) form. Please correct mailing label information if affixed for an existing facility.

(B) Use a separate application supplement for each permit activity. Check the new construction box only if there are no existing tanks and no previous HMUSP has been issued for this facility. Additional approval applications must be accompanied by a description of work and four (4) sets of plans and specifications as appropriate. Additional approval requests that change data previously supplied on Parts IV through VIII of the Hazardous Substance Storage Statement (HSSS) as filed with the California Water Resources Control Board or the SPA as filed with a County of Los Angeles HMUSP application shall include an updated SPA. The container number on the updated SPA must correspond with the previous number submitted.

(C) Assessor parcel identification is required for new permit applications at existing facilities and new construction (no existing HMUSP) applications only.

(D) The information required in Part D is the minimum necessary to allow issuance of a Provisional HMUSP. When a Provisional HMUSP has been issued for a facility, the owner will be required to submit for review and approval a facility plot plan, Leak Detection Program (LDP) and a Tank Monitoring Program (TMP) to be implemented in accordance with a timetable to be included within the Provisional HMUSP as conditions and limitations. New construction plans and specifications must show the location of and include details of all containers and monitoring devices proposed. A TMP must be approved and implemented prior to the issuance of a full term HMUSP.

(E) A HMUSP application fee must accompany all applications. The state surcharge is required for first time HMUSP applications (not required for additional approvals). Specify the number of tanks at the facility.

(F) Persons that have been notified to file for a HMUSP and do not store any hazardous materials underground should check the appropriate box and return this form to avoid any unnecessary follow-up mailings.

The storage of hazardous waste in an underground tank where the specific tank is named in a hazardous waste facility permit issued by the California Department of Health Services is not subject to the HMUSP requirements. Owners of such facilities must furnish the permit number for facilities where this exclusion is requested.

Final interceptors in industrial waste pretreatment systems, catch basins, refinery pipelines, lagoons, stormdrains, oil field gathering lines, well cellars, above ground storage tank spill containment, unlined pits or sumps, and piping not directly associated with a permitted facility are not subject to a HMUSP.

(G) Existing facility and new construction HMUSP application supplements and SPA's must be signed by:

1) A principal executive officer at the level of vice-president or by an authorized representitive. The representitive must be responsible for the overall operation of the facility where the tank(s) are located.
2) A general partner proprietor.
3) A principal executive officer, ranking elected official or authorized representitive of a public agency.

Additional approval application supplements may be signed by a person under contract to and authorized by the owner/operator of a facility.

CNI MANUFACTURING

FIL-SPIL CONTAINMENT BOX

SPECIFICATIONS:
MANHOLE SKIRT: 36" x 36" x 15"—14 gauge galvanized with reinforced 14 gauge channels.
COVER: 3/8" floor plate with 2½" x 13" fill covers, reinforced with withstand tanker weight.
FILL COVERS: Pull handles for easy removal.
POPPET VALVE ASSEMBLY: Spring-loaded, with high nitrile rubber disc.
GASKET: Tube flange design, low swell high nitrile rubber with stainless steel worm clamp.
GASKET: Viton available upon request.
BUNGS: Minimum 10" ℄ MAXIMUM 18" ℄.

FEATURES:.
- Standard two riser system 10 gallon capacity.
- Special design on cover will not allow dirt or water to enter the containment area.
- Allows for vapors to escape while the fill cover is on.
- Flush mount lift ring on covers.
- Standard 10 gallon containment and poppet valve for two riser systems.
- All water drains onto the ground, not into the containment area.
- Spring loaded valve assembly with pull-chain to allow fluid to drain through a full ¾" hose.
- Drain hose is designed in a downward position at all times allowing for a rapid flow.
- Tube flanged rubber gasket allows replacement from inside the containment area.
- Flanged type gasket allows for complete freedom of movement, either side to side, or up and down, without damage to pipe riser or tank.
- 4" x 18" schedule 40 pipe w/welded pipe nipple and a 90° swing flair fitting.
- Stainless steel outside braid and Teflon inner hose with ¾" male & ¾" female aircraft fittings.
- Screws and gasket to assure water tight.
- Unit can be ordered with pipe plug and up to 40 gallon containment.

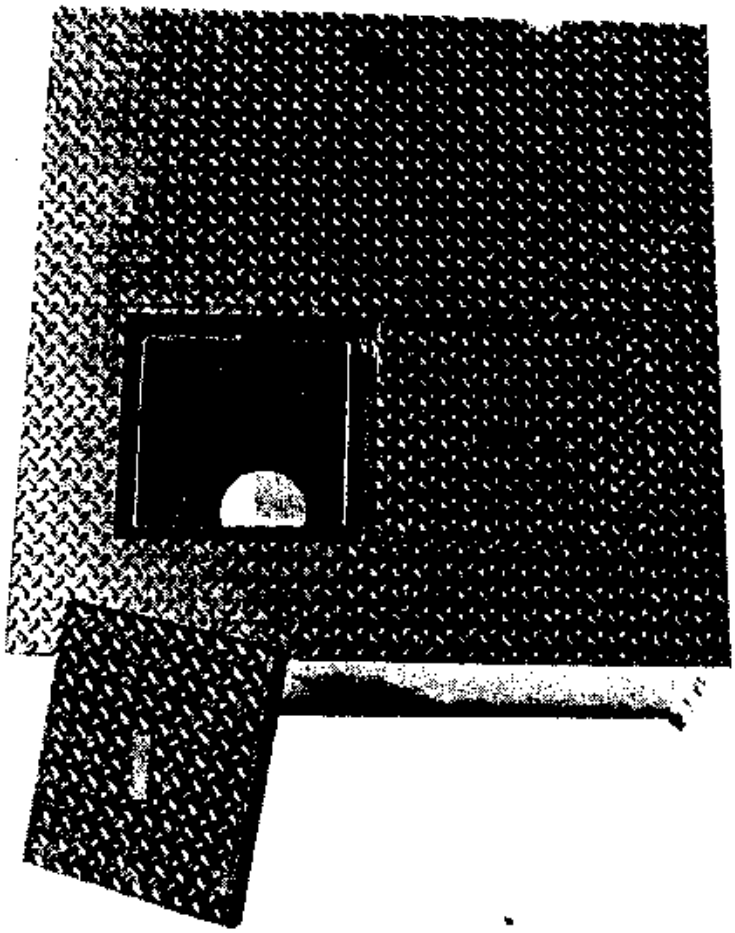
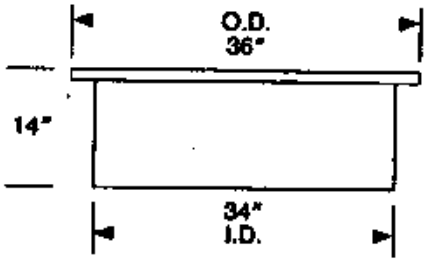
278	WATER DRAIN—USED WHEN ABOVE GRADE WATER NEEDS TO BE DIRECTED AWAY FROM THE TANK AREA
279	PIPE PLUG—USED WHEN PLUG IS NEEDED INSTEAD OF POPPET VALVE.
280	4"x 3" REDUCER ALLOWS USE OF A 3" RISER
281	4"x 2" REDUCER ALLOWS USE OF A 2" RISER





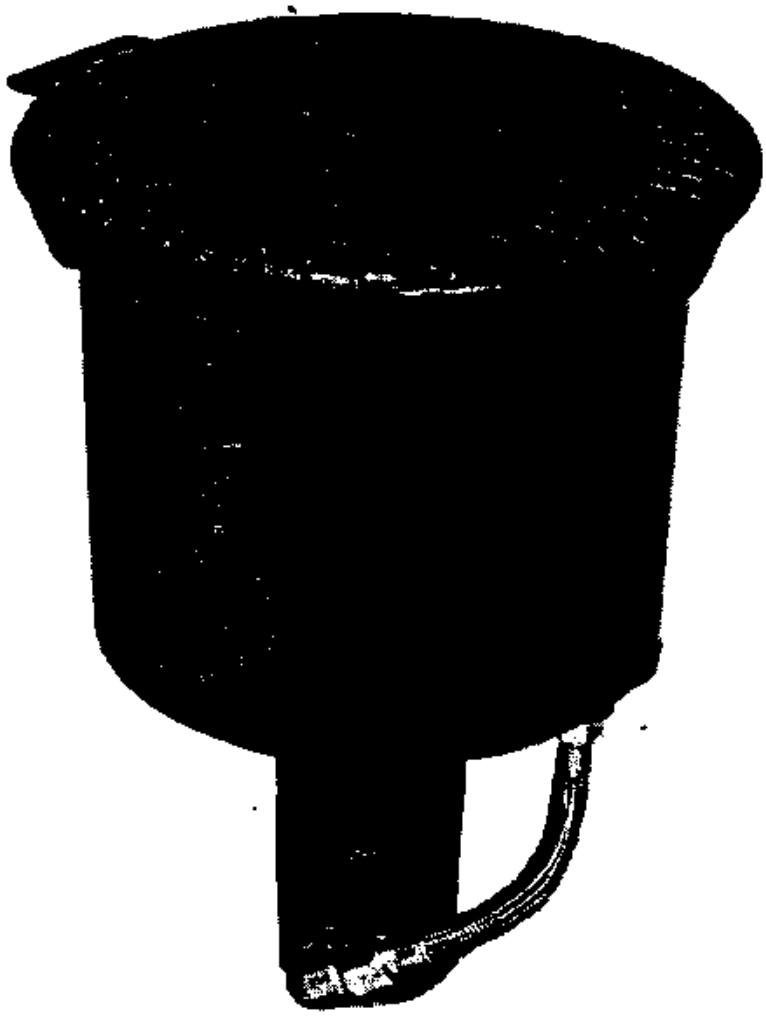
NOTE: See Page "D" in back of catalog on examples on ordering Fil-Spil Boxes.

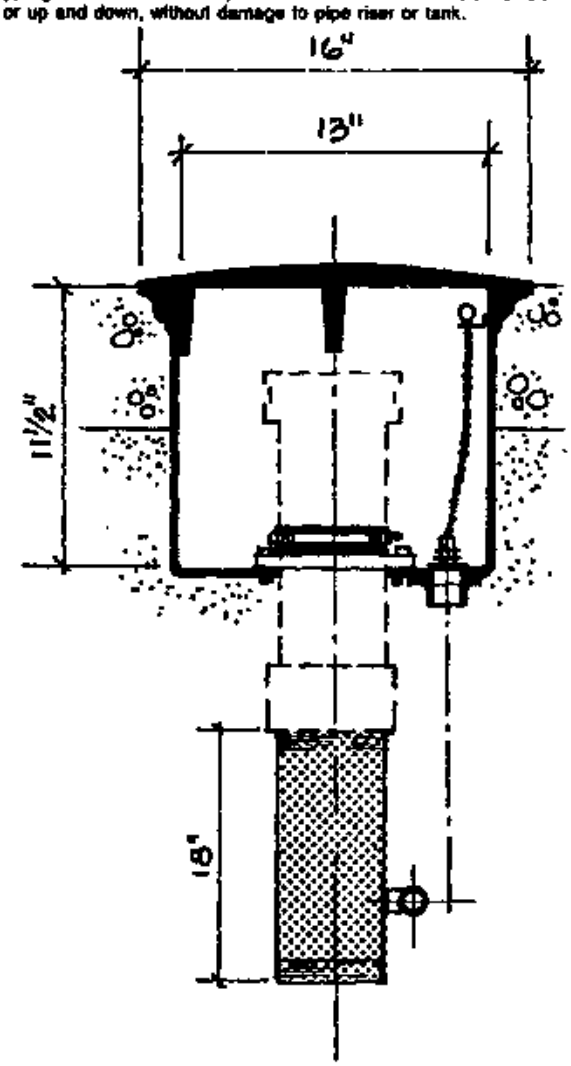
CNI
MANUFACTURING

FIL-SPIL CONTAINMEN
AND "WATER TITE" BO

SPECIFICATIONS:
CONTAINMENT BOX: One piece sand-cast aluminum.
COVER: One piece sand-cast aluminum.
FINISH: Heavy duty epoxy coating.
POPPET VALVE ASSEMBLY: Spring-loaded, with high nitrile rubber disc.
GASKET: Tube flange design, low swell high nitrile rubber.
GASKET: Viton available upon request.

FEATURES:
- Lightweight (9 lbs.) special design on cover will not allow dirt or water to enter the containment area.
- The design of our drain will not allow for a trap causing an air pocket & slow draining.
- Allows for vapor to escape while fill cover is on.
- Indented large finger holes for easy lifting.
- Spring-loaded valve assembly with pull chain.
- Oversize Teflon stainless steel hose for quick draining.
- Hand removable screen for easy cleaning.
- Female plug design in drain provided for future tank and line testing.
- Tube flanged, low swell rubber gasket allows replacement from within the containment area.
- Flange type gasket allows for complete freedom of movement, either side to side, or up and down, without damage to pipe riser or tank.





PATENT PENDING

MODEL NO.	DESCRIPTION
200	CONTAINMENT BOX WITH POPPET VALVE
201	CONTAINMENT BOX WITH PIPE PLUG

281	4" x 2" REDUCER ALLOWS USE OF A 2" RISER

CNI
MANUFACTURING

ROUND FILLBOXES AND MANHOLES

SPECIFICATIONS:
OUTER RING: Heavy cast iron.
COVER: 3/8" non-skid floor plate.
SKIRT: 14 gauge sheet metal spot welded and riveted to cast ring.

FEATURES:
- Reinforced cover is lightweight, yet rated to withstand 24,000 lbs. Lift handle on all covers 24" and larger.
- All boxes requiring screwed down covers are equipped with 3/8"-16 allen flat head screws.
- Tamper proof allen screws are available as an option.
- 1/8" recessed area to accept our Part # 260.

Subject: Records Search – Need to obtain building record information

Site: 14005 Live Oak Avenue
Irwindale, CA 91706

Dear Ms. Nieto,

Environmental Support Services (ESS) is in the process of conducting a records search for an environmental audit at a site in Irwindale, CA. This search includes researching the history of the site. I hereby request copies of all building permits and certificates of occupancy for the following address:

Site: 14005 Live Oak Avenue
Irwindale, CA 91706

Should you have any questions concerning this request for information, please call me at (949) 429-3564. Your expedient processing of this request in greatly appreciated.

Sincerely,
Environmental Support Services

Shannon Castagno
Project Manager

WELL INVESTIGATION PROGRAM - FORMER WASTE OIL TANK AREA INVESTIGATION FOR HUGHES MARKETS PROPERTY AT 14005 LIVE OAK AVENUE, IRWINDALE, CA → new site address for new tank install
(FILE NO. AB 108.1711)

This letter is in response to our October 13, 1994 meeting during which closure of the former waste oil tank area at the subject site was discussed. A thorough review of the file revealed that your consultant, Woodward-Clyde Consultants, had submitted three reports pertaining to the investigation performed at the former waste oil tank area. These reports are:

1) Investigation of Waste Oil Tank Area at 14041 East Live Oak Avenue, Irwindale, California; dated December 1991.

2) Tank Closure Report for the Waste Oil Tank; dated January 23, 1992.

3) Report of Excavation, Hughes Markets Site; dated August 1992.

The following summaries and comments are based on the review of the above mentioned reports and the discussion as per our October 13, 1994 meeting.

GENERAL WASTE OIL TANK INFORMATION

1) A 2,000-gallon waste oil tank was removed on April 23, 1991 from the premise in accordance with Permit #8058B, File #593, issued by the County of Los Angeles Department of Public Works.

2) Laboratory analytical results of the tank contents using EPA Method 8015 indicated that over 99% were petroleum hydrocarbons (C5-C30).

Re: File No. I-00593A
Former 14041 East Live Oak Avenue
Irwindale, CA

Dear Mr. Chaing:

In mid-June I called you to discuss the specific requirements for a response to your department's May 25, 2000 letter to Wohl Property Group regarding the above-referenced site. During our conversation you stated that the May 25, 2000 letter was a form letter and that all the California Regional Water Quality Control Board (CRWQCB) required at this time was copies of the available information on USTs, formerly located on the site because CRWQCB did not have any of this information. I am submitting copies of the information that was found in the Los Angeles County Department of Public Works (LACDPW) files. This information shows that the former USTs located on that portion of the former property owned by our client and managed by Wohl Property Group were closed with the LACDPW or with CRWQCB. The address of the new site is 5305 Rivergrade Road and it comprises only a portion of the former property.

The USTs on the subject parcel consisted of three 10,000 gallon USTs that were removed in 1987 by Western Environmental Services and a 2,000 gallon waste oil tank that was removed by Woodward-Clyde consultants in 1991. A LACDPW closure letter dated February 1, 1988 was issued for the three 10,000 gallon USTs. A closure letter dated November 3, 1994 was issued by CRWQCB. I am sending you copies of the closure letter along with the closure reports.

The current site has three USTs that were installed in 1992. Reportedly the tanks are double-walled Plasteel with appropriate alarms, spill containment, and overflow protection. A review of the LACDPW files indicates that these USTs are in compliance with the 1998 upgrade requirements.

To the best of our knowledge, all other former USTs associated with the 14041 East Live Oak Avenue site were located on that portion of the site not included within this recent property transfer. Please review the attached information. If you have any questions you can call me at 913.344.1151.

Sincerely,

Dear Mr. Parsoneault:

UST LOCAL OVERSIGHT PROGRAM (LOP)
LEAD AGENCY TRANSFER
CLOSURE PERMIT NO. 8058B
LOCATION: 14041 EAST LIVE OAK AVENUE, IRWINDALE

As discussed in our meeting held on February 18, 1993, between your consultant Woodward Clyde, the Regional Water Quality Control Board (RWQCB) and our agency it was concluded that the site be referred to the (RWQCB) for Lead Agency status. This was due to the concern for possible vapor transport and the sensitivity of the site location within the San Gabriel Well Investigation Program.

The site will be rejected from our LOP and no further costs will be billed to you for this project. We do request, however, that our agency be carbon copied on all reports regarding the status of the project for our records.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

Very truly yours,

WORKPLAN TO CONDUCT REMEDIAL INVESTIGATION
PREPARED BY: WOODWARD CLYDE
REPORT DATE: MAY 18, 1992
CLOSURE PERMIT NO. 8058B
LOCATION: 14041 EAST LIVE OAK AVENUE, IRWINDALE

This office has reviewed the subject document. Please be advised that prior to approval of the in-situ bioremediation project, the Department of Toxic Substances Control must be informed and a variance obtained. Please contact Paul Hadley at (916) 324-3823 for more information regarding this matter. Also, additional investigation was proposed, however, the plot plan provided by Williamson and Schmid does not clearly show the location of the former waste oil tank, previous boring locations, and proposed boring locations.

Please submit a revised plot plan to this office by October 30, 1992.

Notify Dave Lobato at (818) 458-4374 a minimum of 72 hours prior to commencing any significant investigation, remediation, or assessment activities on site. The Los Angeles County Department of Public Works may disregard the work performed if the County was not properly notified.

Correspondence should be submitted in duplicate to the Los Angeles County Department of Public Works, UST Local Oversight Program, Annex Building, P. O. Box 1460, Alhambra, CA 91802-1460.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

INSPECTOR'S REPORT

TO: Dave Lobato/Taylor DATE: 9-16-92

FROM: Tom CUSTARD FILE: I-593

INDUSTRY: United Concrete Pipe
14041 E. Live OAK ave., Irwindale

REPORT: This was a Scheduled oversight inspection For drilling of exploratory borings For Site assessment. No representatives From Woodward Clyde Consultants were Seen when I arrived on-site. According to Construction Manager John Navarro, The drilling was rescheduled. I was not notified previously. Much OF the area around the Former Tank area is under Construction. Proposed boring locations appeared to be Marked With Stakes. (PHoto) Surface evidence OF at least three (3) Monitoring Wells were Seen. (Photo's) TWO (2) of the Monitoring Wells exist near a Shallow Pit. The area around the Former Waste oil Tank does not appear to be under Construction. Several Large Soil piles are Seen in the area. No Signs of Contamination were noted.

Dear Mr. Parsoneault:

UST LOCAL OVERSIGHT PROGRAM REVIEW SHEET
INVESTIGATION OF WASTE OIL TANK AND TANK CLOSURE REPORT
PREPARED BY: WOODWARD-CLYDE CONSULTANTS
REPORTS DATED: DECEMBER 1991 AND JANUARY 14, 1992
CLOSURE PERMIT NO. 8058B
LOCATION: 14041 EAST LIVE OAK BOULEVARD, IRWINDALE

As discussed in our meeting on February 20, 1992 with Allstaire Callender of Woodward-Clyde and Richard Kaumeyer of the California Regional Water Quality Control Board, our agency is requesting additional investigation to further define the lateral limits of the petroleum contamination.

Although Boring B (drilled approximately 35 feet southeast of the tank) stepped out in the clean soil, the extent of contamination toward the northeast, southwest, and northwest remains undefined by laboratory analysis. Borings should step out into clean soil and encircle the plume.

It is understood that due to the underground utilities and the close proximity of Arrow Highway it would be difficult to drill toward the northeast. However, measures should be taken to determine the possibility of obtaining an encroachment permit to drill in the street.

Also, since it is uncertain as to the historical high groundwater level, it is advised that the investigation extend vertically to a minimum depth of 25 feet below the deepest detectable contamination. Selected soil samples should be analyzed for volatile organics and as mentioned by Richard Kaumeyer of the California Regional Water Quality Control Board soil test should be run for PCB's due to the presence of transformers on the site.

It was discussed that an in situ form of bioremediation is being considered, however, feasibility tests need to be conducted. We require that the State Department of Health Services, Office of Alternative Technologies be notified of this proposed remediation and their requirements be met prior to approval from our office. Please provide this agency with a workplan discussing the next phase of site investigation and remediation by April 30, 1992.

Notify Dave Lobato at (818) 458-4374 a minimum of 72 hours prior to commencing any significant investigation, remediation, or assessment activities on site. The Los Angeles County Department of Public Works may disregard the work performed if the County was not properly notified.

Correspondence should be submitted in duplicate to the Los Angeles County Department of Public Works, UST Local Oversight Program, Annex Building, P. O. Box 1460, Alhambra, CA 91802-1460.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

1.0 INTRODUCTION

1.1 PURPOSE OF SCOPE OF WORK

This report summarizes underground storage tank removals and soil sampling operations performed at United Concrete Pipe Division (United). The subject site is located at 14041 East Live Oak Avenue, Baldwin Park, Los Angeles County, California

The work accomplished under Los Angeles County Permit No. 3361-B, on October 14, 1987 consisted of the removal of three diesel fuel underground storage tanks, and collection and quantitative analyses of 6 soil samples, used to document subsurface soil conditions.

United engaged the services of Rudy's Service Station Equipment Maint., Inc. (Rudy's) to perform the excavation and removal of the underground storage tanks. Western Environmental Services (WES) was employed under verbal agreement by Rudy's to: 1) collect soil samples from beneath the bottom of each tank and 2) prepare this report on tank removal operations. Included herewith are discussions on field procedures, laboratory testing, and analytical results for soil samples recovered during the excavation and subsequent tank removals.

2.0 FIELD PROCEDURES

On October 14, 1987, under the supervision of Los Angeles County Fire Department, three underground diesel fuel storage tanks were removed and disposed of properly. The tank numbers, capacities and contents as determined by field personnel are summarized in Table 1.

TABLE 1
SUMMARY OF UNDERGROUND STORAGE TANKS DATA
UNITED CONCRETE

TANK NO.	CAPACITY (gals.)	CONTENTS
1	10,000	Diesel
2	8,000	Diesel
3	8,000	Diesel

Following the removal of the tanks, six soil samples (1A, 1B, 2A, 2B, 3A, 3B) were collected at a depth of two feet below tank bottom by a WES geologist. Sample locations are shown on Figure 1 - Site Plan.

The samples were recovered from the excavations using a back hoe and quickly placed by hand into four ounce glas sample jars, sealed with a teflon-lined lid, each sample within labeled and immediately stored on ice in an ice chest until transport to the laboratory. WES chain-of-custody procedures were followed to ensure the integrity of samples submitted for analyses.

3.0 GEOLOGY

The United site overlays alluvial sediments, gravels and cobbles interbedded with coarse grained sands of recent age. The elevation of the tank pit areas is approximately 400 feet above seal level; the surrounding topography slopes gently to the South. A review of California Department of Water Resources (DWR) records indicate the first principle aquifer beneath the site is greater than 100 feet below the surface; semi-perched zones may occur at shallower depths.

4.0 LABORATORY TESTING AND RESULTS

All samples were submitted for analyses to Chemical Research Laboratories, Stanton, California. Samples were tested for total recoverable hydrocarbons according to E.P.A. method 418.1. The sample is extracted using a horn-type sonicator and examined by infrared spectroscopy. Laboratory certificate and chain-of-custody records are included in Appendix A and B respectively.

Based on laboratory results for samples collected, it appears hydrocarbon leakage has occurred at the site. Sample reference numbers, locations and test results (in parts per million) are summarized in Table 2.

TABLE 2
SUMMARY OF SOIL SAMPLING
D&K CONCRETE

SAMPLE NO.	LOCATION	E.P.A. 418.1 (ppm)
1A	Southside of northern diesel tank	100
1B	Northside of northern diesel tank	ND(1)
2A	Southside of southeast diesel tank	15
2B	Northside of southeast diesel tank	140
3A	Southside of southwest diesel tank	ND(1)
3B	Northside of southwest diesel tank	6

5.0 CONCLUSIONS

In accordance with both State and County Guidelines for Underground Storage of Hazardous Materials, WES has completed a field sampling program associated with the removal of underground fuel tanks at the United facility. The results of field study indicates relatively low concentration of petroleum based hydrocarbons have leaked into the soil at the tank pit locations. Due to the deep groundwater table and dense conglomeratic subsurface soil conditions, we recommend United following regulatory approval backfill, compact and resurface the existing excavation.

If we can be of further assistance or provide further information, feel free to call.

Sincerely

Western Environmental Services

David D. Aronne
Project Geologist

TO BE COMPLETED BY THE DEPARTMENT OF PUBLIC WORKS

PURSUANT TO SECTION 11.80.070B, LOS ANGELES COUNTY CODE, PERMISSION IS H
GRANTED TO PROCEED WITH THE CLOSURE DESCRIBED ABOVE SUBJECT TO THE ATTAC
CONDITIONS AND LIMITATIONS [X]. THIS PERMIT EXPIRES 180 DAYS FROM THE D
BELOW.

T.A. TIDEMANSON
Director of Public Works

CONDITIONS A -- GENERAL

Closures shall be carried out such that all applicable regulations from the following agencies are complied with: Los Angeles County, Department of County Engineer-Facilities; Los Angeles County Fire Department, Fire Prevention Division or the appropriate City Fire Department; South Coast Air Quality Management District; and Los Angeles County Department of Health Services.

The County Engineer and Fire Departments shall be notified in advance of any closure in accordance with the following:

a. Removal of tank shall require a three (3) business day advance notification.

b. Permanent closure of a tank in place or a temporary closure shall require a 30 day written notification.

A fee of $38 per tank shall accompany this application.

All abandoned wells shall be destroyed in such a way that they will not produce water or act as a channel for interchange of water, when such interchange may result in deterioration of the quality of water in any or all water bearing formations penetrated, or present a hazard to the safety and well-being of people and animals.

A well destruction permit issued by the Los Angeles Department of Health Services shall be required for all wells requiring a permit for their initial construction.

Well destruction shall be accomplished according to methods described in the latest "Water Well Standards: State of California" by the Department of Water Resources, contained in Bulletin 74-81, December 1981, or any other methods that will provide equivalent or better protection.

Plans for the decontamination of a facility shall be submitted to the County Engineer for approval no later than 30 days before the commencement of such operations. Other agencies having jurisdiction shall also be notified. These agencies include the California Regional Water Quality Board, the Los Angeles County Department of Health Services, and the South Coast Air Quality Management District.

Decontamination shall require the following, as a minimum:

a. Cleaning operation shall be done under the supervision of persons who understand the hazardous potential of the original liquid stored and its components.

b. The personnel shall be sufficiently skilled to safely carry out such operation.

c. Contaminated materials removed from such facility shall be disposed of at legal point of discharge.

d. The operation shall be carried out in a manner that will not endanger the health of the public and the environment.

CONDITIONS B -- TEMPORARY

All temporary closures shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, "Abandonment or Removal of Underground Tanks," Part A and any other applicable Parts.

A temporary closure shall not exceed 90 days.

CONDITIONS C -- PERMANENT, TANK(S) REMOVAL

1. All tank removals shall be carried out as indicated in Los Angeles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Part D and any other applicable Parts.

2. Owners/operators shall notify the Building Department having jurisdiction at the place of removal if a grading permit is necessary.

3. Removed tanks shall not be transported away from the site until an inspection to establish site integrity is carried by the County Engineer.

4. If an appointment has been arranged with a County Engineer inspector to inspect the removal of a tank, the inspector will only wait at the site a reasonable amount of time (approximately one hour) after arriving for the removal to commence. Another closure fee may be charged if the inspector has to return to the site.

5. After inspection, tanks shall be transported to a legal disposal point.

6. If the tank had stored materials other than motor fuel, fuel oil, waste oil, site integrity shall be demonstrated using the soil sampli... and analysis procedures described in CONDITIONS D below.

7. The site shall be backfilled and recompacted to a relative compaction of 90%.

CONDITIONS D -- PERMANENT, TANK(S) IN PLACE

1. All permanent closures of tanks in place shall comply with Los A...eles County Fire Department, Fire Prevention Division, Supplement #A -- Inspection Guide #6, Parts B or C, and any other applicable Parts.

2. Owners/operators shall demonstrate part site integrity as follows:

   a. Test borings shall be slant drilled to intercept a point beneath the center of the tank, if possible. If slant drilling is not feasible, the test borings may be drilled vertically and the reason stated in the report in 2.h. below.

   b. For single tanks, a minimum of two test borings will be required, each located on opposite sides of the tank along the major axis of the tank.

   c. For multiple tanks, as a minimum, borings shall be placed at ... foot intervals around the tank cluster. The actual number ... location of borings shall be evaluated on a case-by-case bas... Tanks separated by 20 feet or more shall be considered single tanks for the purposes of test location and placement.

   d. Soil samples shall be taken at depths of 5, 10, 20, 30 and 40 feet below grade level.

   e. A Shelby Tube or a Modified California Sampler shall be utilized for taking all soil samples.

   f. Soil samples shall be capped immediately with teflon or aluminum.

   g. Soil samples shall not be extruded in the field but are to be immediately placed in a refrigerated ice chest and transported to a state certified laboratory for analysis, using suitable methods.

   h. A report containing the results of the above analysis shall be submitted to the County Engineer.

3. If the soil analysis in 2. above indicates the presence of contaminants, the County Engineer shall require a site investigation as described in Chapter V of the County's "Underground Storage of Hazardous Materials -- Guidelines."

4. A report shall be submitted to the County Engineer containing the ...

NOTICE TO CLOSURE PERMIT APPLICANTS

The South Coast Air Quality Management District (SCAQMD) has adopted Rule 1166 regulating emissions of Volatile Organic Compounds (VOC) from decontamination of soil effective August 6, 1988.

In addition to the requirements of your Closure Permit, persons excavating any underground storage tank that previously contained VOC's must:

-- Notify the SCAQMD Executive Officer by telephone at (818) 572-6195, 24 hours prior to tank excavation. 1166(e)(1)(A)

-- Monitor the excavated material during the excavation for VOC contamination. 1166(e)(1)(B)

-- When VOC contamination is detected:
  - Cease excavation
  - Cover the contaminated soil until implementation of approved mitigation measures. 1166(e)(1)(C)
  - Notify the SCAQMD Executive Officer at (818) 572-6195 within 24 hours of detection of VOC contaminated soil. 1166(e)(2)(A)

-- A person shall not engage in or allow any on-site or off-site spreading of VOC contaminated soil which results in uncontrolled evaporation of VOC to the atmosphere. 1166(e)(3)

Exemptions

-- Treatment of less than one (1) cubic yard of contaminated soil. 1166(d)(1)(A)

-- Decontamination of soil containing organic compounds that have initial boiling point of 302°F or greater, Reid Vapor Pressure less than 80mm Hg or Absolute Vapor Pressure less than 36mm Hg at 20°C. 1166(d)(1)(B),(F)

-- Removal of soil for sampling purposes pursuant to EPA methods. 1166(d)(1)(C)

-- Accidental spillage of five (5) gallons or less of VOC. 1166(d)(1)(D)

-- Decontamination of soil which is contaminated through natural seepage of VOC from oil and gas wells or other natural sources. 1166(d)(1)(E)

SPECIFIC QUESTIONS ON RULE 1166 SHOULD BE REFERRED TO THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT (818) 572-6200

CLOSURE PERMIT SUPPLEMENT
HAZARDOUS MATERIALS UNDERGROUND STORAGE
LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION
900 S. FREMONT AVENUE
ALHAMBRA, CA 91803

Closure Permit No.: 8058 B
File No.
I- 593 - 35

PART 1 OF 2

To satisfy the permanent closure requirements for underground storage tanks previously storing hazardous materials, site integrity must be demonstrated by the analysis of soil samples and, if applicable, groundwater samples as outlined below. These requirements are in addition to the conditions listed on the Application for Closure or contained in an approved Closure Plan.

1. Samples shall be obtained at the sampling points (SP) indicated on the attached plot plan.

2. For each SP, samples shall be obtained at the following depths:

SP	Depth(s)	Compounds	Analysis Method
3A	2-4' below tank invert	TPH + BTXE	418.1 + 8020
1 sample every 20' of piping	2-4' below piping	"	"

dn4/FPERMIT Rev. 3/90

Cont'd on Page 2

3. All soil samples obtained shall be discrete, undisturbed and unexposed prior to analysis. The method used to obtain the samples and the date of sampling shall be included in the final report.

4. If groundwater is encountered during sampling, a groundwater monitoring well shall be established at the most downgradient sampling point. The well shall be developed by removing a minimum of four well volumes and a groundwater sample shall be obtained and analyzed.

5. The analytical results for all soil samples shall be expressed milligrams per kilogram (mg/kg), or micrograms per kilogram (ug/kg) as appropriate. Practical quantitation limits of 5-10 ug/kg (ppb) for volatile organics and 1 mg/kg (ppm) for the petroleum hydrocarbons must be achieved by the laboratory. Analytical results for groundwater samples shall be expressed in ug/l (ppb) and practical quantitation limits of .5-5 ug/l (ppb) for volatile organics, and 1 mg/l (ppm) for petroleum hydrocarbons must be achieved by the laboratory.

6. Analytical results shall be reported on laboratory letterhead and shall include the following information: a) The date the analysis was conducted; b) The method of extraction (if applicable); c) Detection limits for each analytical procedure and determiantion; d) The method of analysis; e) Signature of chemist certifying results.

7. All soil/groundwater samples obtained shall be handled and transported to laboratory in strict accordance with applicable EPA regulations utilizing chain-of-custody procedures. Chain-of-custody documentation shall be included in the final report.

8. If the soil/groundwater analysis indicates undefined contamination at the facility, additional sampling shall be required to define the vertical and lateral extent present.

9. A final report that contains all of the above required information shall be submitted to the office above within one (1) month from the sampling date or 180 days from the date of this permit, whichever is earlier.

ATTENTION CONTRACTOR

NOTIFICATION REQUIREMENTS

Pursuant to Los Angeles County Code, Section 11.78.045, and the Conditions and Limitations of the attached Hazardous Materials Underground Storage Closure Permit, you are required to complete ALL of the agency notifications indicated below within the time period specified prior to commencement of work on this closure.

LOS ANGELES COUNTY
DEPARTMENT OF PUBLIC WORKS
CLOSURE REPORT REQUIREMENTS

A closure report shall be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 1460, Alhambra, CA 91802-1460, containing:

1. File number of facility and closure permit number.
2. Plot plan to scale showing locations of tanks, sampling points, buildings, adjacent streets and north arrow.
3. Description of methods for obtaining, handling and transporting samples.
4. Time and date samples were obtained.
5. If borings were established, boring logs certified by a CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.
6. Chain-of-custody documentation initiated by person obtaining sample through person at State Department of Health Services certified laboratory.
7. Disposal destination of tanks and evidence of legal disposal.
8. Analysis results by a State certified laboratory submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.
9. Documentation as to depth of groundwater at facility.
10. Manifests to document hazardous waste disposal of any removed soil.
11. Any observations of site contamination.
12. Remedial action plan to mitigate contamination.
13. Report to be signed by CA Registered Geologist, CA Certified Engineering Geologist or CA Registered Civil Engineer with sufficient experience in soils.

UNDERGROUND STORAGE TANKS PROGRAM –
METHYL TERTIARY BUTYL ETHER (MTBE) TESTING REQUIREMENT
FORMER UNITED CONCRETE PIPE
14041 EAST LIVE OAK AVENUE, IRWINDALE (FILE NO. I-00593A)

Dear Mr. Wohl:

Pursuant to Senate Bill 521 and Section 25299.37.1 of Chapter 6.75 of Division 20 of the California Health and Safety Code, testing for MTBE has been required at all underground storage tank sites since October 1997.

We have reviewed our case file regarding the subject site and find that previous soil investigations do not contain laboratory analytical test results for MTBE or other fuel oxygenates. Therefore, you are required to provide representative MTBE and other fuel oxygenates data for soils at the subject site.

At least one soil test boring is to be completed at the center of each soil contamination plume and/or release area (i.e., dispenser island area, underground storage tank area, and/or along pipelines). Soil borings at each location shall extend vertically downward until at least thirty feet of clean soils are demonstrated without any gasoline constituents (TPH_G, BTEX, MTBE or other fuel oxygenates), detected. Soil test borings shall not be drilled into groundwater at the site. If groundwater impacts are anticipated, then groundwater-monitoring wells are required to determine impacts to groundwater quality.

Soil samples shall be collected at 5-foot intervals in all borings for lithological soil description and chemical analyses by EPA Method 8015 for TPH_G and by EPA Method 8260B for benzene, toluene, ethylbenzene, xylene (BTEX) and fuel oxygenate compounds including MTBE, di-isopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), tertiary amyl methyl ether (TAME), and tertiary butyl alcohol (TBA). All analytical data must be reported by a California-certified laboratory.

In order to expedite the investigation, a workplan is not needed to conduct the limited soil investigation. However, if the results of the investigation do not define the full extent of the soil contamination, or if there are potential groundwater impact, then a workplan to install groundwater-monitoring wells is required to be submitted with your technical report, containing the results of this investigation.

A Health and Safety Plan shall be prepared, made available to field personnel, and implemented while conducting the fieldwork. All work must be performed by or under the direction of the registered geologists or registered civil engineer. A statement is required in the report that the registered professionals in responsible charge actually supervised or personally conducted all the work associated with the project. All reports submitted to this office must conform to the "Guidelines for Report Submittals - Revised June 1993" published by the Los Angeles County Department of Public Works (copy enclosed).

Pursuant to Section 13267 of the California Water Code, you are hereby required to submit a technical report containing the results of the soil investigation by **July 15, 2000**. As indicated above, if the results of this investigation indicate that the full extent of soil contamination is not defined, then a workplan for supplemental soil and/or groundwater characterization is required to be submitted with your technical report due by **July 15, 2000**. Failure to comply with the due date may result in an enforcement action by the Regional Board of up to $1,000.00 per day for each day the report is not received. The Regional Board can assess these civil liabilities at any time after **July 15, 2000.**

Please notify us at least seven days prior to the date that you plan to commence site assessment activities. If you have any additional questions additional concerning soil testing and/or reporting requirements please contact Mr. John Chiang at (213) 576-6708 or me at (213) 576-6702.

Sincerely,

Gregg Kwey
Senior Water Resource Control Engineer

VAPOR EXTRACTION PILOT TEST (check all that apply)

In addition to the requirements on Page 1 and 2, this section must be filled out whenever applicable

Has the pilot test been approved: Yes[ ] No[ ] Are design parameters known: Yes[ ] No[ ]

Is the equipment appropriate for the test: Yes[ ] No[ ] Are all the gauges working properly: Yes[ ] No[ ]

Is permit to operate the system on-site: Yes[ ] No[ ] Is screen interval known of the wells to be tested: Yes[ ] No[ ]

Time test started: _____ Time test stopped: _____ Duration of test: _____

Actual flow rate: _____ SCFM What gauge was used to measure flow rate: _____

Is vacuum recorded in all the wells: Yes[ ] No[ ] Max. vacuum in the extraction well: _____ in ∀ of water

What is max. vacuum in the nearest well: _____ What is max. vacuum in the farthest well: _____

Comments:

OTHER COMMENTS

The purpose of this inspection is to determine who is the RP of the site. On 10/26/99, I visited the site and found the site is a vacant lot, nothing on the ground.

File indicated that all tanks had been removed in 1992, and no further action was issued to this case by WIP on 12/15/92. At that time, LACDPW was the lead agency. However, for some reason, LACDPW referred this case back to us and the case was reopened on 3/15/93. Since then, no one handles this case until NB attempted to request for additional information on 5/20/98.

Recommend continues to investigate for more information from local agency and to identify the RP.

NEW LANDOWNER NOTIFICATION AND PARTICIPATION REQUIREMENTS ON THE CORRECTIVE ACTION PROCESS PURSUANT TO RECENT AMENDMENTS TO THE HEALTH AND SAFETY CODE AND THE PORTER COLOGNE WATER QUALITY CONTROL ACT
FORMER UNITED CONCRETE PIPE, 14041 E. LIVE OAK AVE., IRWINDALE (I-00593)

Dear Mr. Parsoneault:

Your case has been referred to our office recently. The California Regional Water Quality Control Board, Los Angeles Region, is the public agency with primary responsibility for the protection of ground and surface water quality for all beneficial uses within Los Angeles and Ventura counties. As such, we are the lead regulatory agency for overseeing corrective action (assessment and/or monitoring activities) and cleanup of releases from leaking underground storage tank systems at the subject site.

Pursuant to recent changes of the California Health and Safety Code Chapter 6.75 (Section 25299.37.2) and Division 7 of the Porter Cologne Water Quality Control Act under AB 681, the Regional Board is required to notify all current fee title holders for the subject site or sites impacted by releases from underground storage tanks prior to considering corrective action and cleanup or case closure. Since you are identified as the current primary or active responsible party for corrective action and/or cleanup at the subject site, we are requesting that you provide us with a complete mailing list of all record fee title holders for the subject site. Therefore, please provide the name, mailing address, and telephone for all record fee title holders for the subject site together with a copy of county record of current ownership (grant trust deed), available from the County Recorder

If site assessment and/or monitoring data provided for corrective action work ongoing at the subject site indicate that release(s) from the underground storage tank systems have impacted offsite property, then please provide the name, mailing address, and phone number for all record fee title holders for the subject site and any offsite property(ies) impacted by releases from the subject site, together with a copy of county record of current ownership (grant trust deed), available from the County Recorder's Office, for each property affected for verification.

Please submit the requested information to the Regional Board by March 10, 1999, If you need additional information, please contact me at (323) 266-7547 or gkwey@rb4.swrcb.ca.gov.

Sincerely,

GREGG K. KWEY

As discussed in our phone conversation today, I am trying to locate the staff from your company who worked on this case. We have very little information in our file on this case. Attached please find a copy of the March 15, 1993, letter from Los Angeles County Department of Public Work and three maps showing the location of the site.

Please call me at (323) 266-7561, if you have any new information on this case. Thank you in advance for your assistant.

Site appears vacant lot.

UNDERGROUND TANKS PROGRAM
REQUEST FOR ADDITIONAL INFORMATION
14041 EAST LIVE OAK AVENUE, IRWINDALE (I-00593A)

I am in the process of reviewing your Underground Storage Tank (UST) case file for possible closure. The file does not contain all the information necessary for me to make a decision concerning your site.

In order for us to make a decision for closure of your UST site, we will need the following information:

___X___ a. Tank removal and/or repair information (include dates and if free product was discovered, was it removed?)

___X___ b. Scaled site map showing the location of all former and existing tanks

___X___ c. Tabulated soil sample analytical results

___X___ d. The laboratory Quality Assurance/Quality Control protocol

___X___ e. Information on site geology (brief description) including groundwater gradient direction.

___X___ f. The soil boring logs

___X___ g. The depth to drinking water aquifer.

Please provide this information to our office by **July 15, 1998**.

If you have any questions, please call Nhan Bao at (213) 266-7561.

Sincerely,

Nhan Bao

Dear Mr. Parsoneault:

UST LOCAL OVERSIGHT PROGRAM (LOP)
LEAD AGENCY TRANSFER
CLOSURE PERMIT NO. 8058B
LOCATION: 14041 EAST LIVE OAK AVENUE, IRWINDALE

As discussed in our meeting held on February 18, 1993, between your consultant Woodward Clyde, the Regional Water Quality Control Board (RWQCB) and our agency it was concluded that the site be referred to the (RWQCB) for Lead Agency status. This was due to the concern for possible vapor transport and the sensitivity of the site location within the San Gabriel Well Investigation Program.

The site will be rejected from our LOP and no further costs will be billed to you for this project. We do request, however, that our agency be carbon copied on all reports regarding the status of the project for our records.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

Very truly yours,

January 19, 1993

As per my telephone conversation with Mr. Richard Kaumeyer of Regional Water Quality Control Board. It was discussed that no additional information/reports have been submitted to either agency. Mr. Kaumeyer, informed me that vent wells have been installed and their consultant Woodward Clyde is putting the report together. He also informed me that they may be reconsidering the in-situ Bio-remediation proposal as not a feasible alternative. The RWQCB, would like to see VOC vapor sampling (air). If vapor concentrations are high vapor extraction may be required. Heavy hydrocarbons may be allowed to be left in place, however, the RWQCB would want a groundwater monitoring well. If groundwater contamination is high it is possible more groundwater monitoring wells would be required. Mr. Kaumeyer will be given a chance to comment on the RAP.

Dear Mr. Parsoneault:

UST LOCAL OVERSIGHT PROGRAM REVIEW SHEET
WORKPLAN TO CONDUCT REMEDIAL INVESTIGATION
PREPARED BY: WOODWARD CLYDE
REPORT DATE: MAY 18, 1992
CLOSURE PERMIT NO. 8058B
LOCATION: 14041 EAST LIVE OAK AVENUE, IRWINDALE

This office has reviewed the subject document. Please be advised that prior to approval of the in-situ bioremediation project, the Department of Toxic Substances Control must be informed and a variance obtained. Please contact Paul Hadley at (916) 324-3823 for more information regarding this matter. Also, additional investigation was proposed, however, the plot plan provided by Williamson and Schmid does not clearly show the location of the former waste oil tank, previous boring locations, and proposed boring locations.

Please submit a revised plot plan to this office by October 30, 1992.

Notify Dave Lobato at (818) 458-4374 a minimum of 72 hours prior to commencing any significant investigation, remediation, or assessment activities on site. The Los Angeles County Department of Public Works may disregard the work performed if the County was not properly notified.

Correspondence should be submitted in duplicate to the Los Angeles County Department of Public Works, UST Local Oversight Program, Annex Building, P. O. Box 1460, Alhambra, CA 91802-1460.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

UST LOCAL OVERSIGHT PROGRAM REVIEW SHEET
TANK CLOSURE REPORT
PREPARED BY: WOODWARD-CLYDE CONSULTANTS
REPORT DATE: FEBRUARY 7, 1992
CLOSURE PERMIT NO. 7963B
LOCATION: 14041 EAST LIVE OAKS AVENUE, IRWINDALE

As of this time no contamination has been detected at this location of the site. This is a large parcel of land with many different owners. Only one RP has been named the See attached letter

The report documenting the removal of two fuel tanks has been reviewed. Please indicate if the pump island associated with the fuel tanks was investigated. If it was not, samples are required as specified in closure permit.

Submit the requested information to this office by September 30, 1992.

Notify Dave Lobato at (818) 458-4374 a minimum of 72 hours prior to commencing any significant investigation, remediation, or assessment activities on site. The Los Angeles County Department of Public Works may disregard the work performed if the County was not properly notified.

Correspondence should be submitted in duplicate to the Los Angeles County Department of Public Works, UST Local Oversight Program, Annex Building, P. O. Box 1460, Alhambra, CA 91802-1460.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

Los Angeles, CA 90065

Dear Mr. Parsoneault:

UST LOCAL OVERSIGHT PROGRAM REVIEW SHEET
INVESTIGATION OF WASTE OIL TANK AND TANK CLOSURE REPORT
PREPARED BY: WOODWARD-CLYDE CONSULTANTS
REPORTS DATED: DECEMBER 1991 AND JANUARY 14, 1992
CLOSURE PERMIT NO. 8058B
LOCATION: 14041 EAST LIVE OAK BOULEVARD, IRWINDALE

As discussed in our meeting on February 20, 1992 with Allstaire Callender of Woodward-Clyde and Richard Kaumeyer of the California Regional Water Quality Control Board, our agency is requesting additional investigation to further define the lateral limits of the petroleum contamination.

Although Boring B8 (drilled approximately 35 feet southeast of the tank) stepped out in the clean soil, the extent of contamination toward the northeast, southwest, and northwest remains undefined by laboratory analysis. Borings should step out into clean soil and encircle the plume.

It is understood that due to the underground utilities and the close proximity of Arrow Highway it would be difficult to drill toward the northeast. However, measures should be taken to determine the possibility of obtaining an encroachment permit to drill in the street.

Also, since it is uncertain as to the historical high groundwater level, it is advised that the investigation extend vertically to a minimum depth of 25 feet below the deepest detectable contamination. Selected soil samples should be analyzed for volatile organics and as mentioned by Richard Kaumeyer of the California Regional Water Quality Control Board soil test should be run for PCB's due to the presence of transformers on the site.

It was discussed that an in situ form of bioremediation is being considered, however, feasibility tests need to be conducted. We require that the State Department of Health Services, Office of Alternative Technologies be notified of this proposed remediation and their requirements be met prior to approval from our office. Please provide this agency with a workplan discussing the next phase of site investigation and remediation by April 30, 1992.

Notify Dave Lobato at (818) 458-4374 a minimum of 72 hours prior to commencing any significant investigation, remediation, or assessment activities on site. The Los Angeles County Department of Public Works may disregard the work performed if the County was not properly notified.

Correspondence should be submitted in duplicate to the Los Angeles County Department of Public Works, UST Local Oversight Program, Annex Building, P. O. Box 1460, Alhambra, CA 91802-1460.

If you have any questions regarding this matter, please contact Yvonne M. Taylor at (818) 458-3980.

Dear Mr. Richardson:

UST PILOT PROGRAM REVIEW SHEET
HAZARDOUS MATERIALS UNDERGROUND STORAGE
TANK CLOSURE REPORT
CLOSURE PERMIT NO. 4654B AND 5418B
FACILITY: 14041 EAST LIVE OAK AVENUE

This office has reviewed the subject document(s) submitted on December 5, 1989. The comments in this letter must be addressed and submitted to this office by ~~July 30, 1990~~.

In order to better evaluate the Tank Closure Report, the information indicated on the note below must be submitted.

Note: Discuss the removal (Permit No. 4654B) of the 500 gallon concrete sump which was removed March 23, 1989. Discuss the use of diesel fuel used as a releasing agent for concrete pipe molds.

Mineral Oil

You are cautioned that any contaminated soils or hazardous materials generated during the approved operation must be manifested and transported to a hazardous waste disposal facility as required by California Health and Safety Code, Division 20, Chapter 6.5, unless evidence is presented indicating that the material may be disposed of at a less restricted facility. Copies of all completed manifests shall be submitted to this office as part of the final report.

Correspondence should be submitted to the Los Angeles County Department of Public Works, UST Pilot Program, Annex Building, P.O. Box 1460, Alhambra, CA 91802-1460.

Correspondence should be submitted to the Los Angeles County Department of Public Works, UST Pilot Program, Annex Building, P.O. Box 1460, Alhambra, CA 91802-1460.

900 S. Fremont Avenue
Alhambra, CA 91803-1331

Attention: John Awuja

Dear John:

Here is a chronology of events concerning the removal of the 500 gallon concrete sump and 3000 gallon steel tank that had been used for waste oil collection and storage.

4-10-87	HMUSP No. 157 (includes waste oil sump as tank No. 8)
10-5-87	Test Boring Report (Hydrosolutions)
8-2-88	Permit 4654B pulled for 500 gallon concrete drain oil sump
1-12-89	Discovery of 3000 gallon steel tank
3-16-89	Permit 5418B for 3000 gallon steel tank only (pulled by Rudy's)
*3-31-89	Tank cleaned, inspected and removed soil samples S1 and S2 collected
4-13/14-89	Excavation of contaminated soil 9 samples tested by mobile lab
5-31-89	Material divided into 5 piles
*6-1-89	Each pile sampled
*6-15/16-89	All material screened
6-19-89	Fines (-1 inch) hauled to Casmalia
6-19/23-89	Excavation backfilled
6-26-89	Letter to Nichole
7-14-89	Report from Terra-Tech
8-1-89	Discovered permit 5418B covered only 3000 gallon tank
