INSPECTOR'S REPORT

TO: DAVE LOGATO DATE: 4-9-90

FROM: TONY PALAGYI FILE: 593-3X

INDUSTRY: UNITED CONCRETE PIPE
14041 LIVE OAK AVE, BALDWIN PARK

REPORT: I WAS MET ON SITE BY MR. FRITZ GOBLER OF U.C.P. TOGETHER WE INSPECTED THE FORMER TANK LOCATIONS. PHOTO #1 SHOWS THE AREA WHERE THE MOST RECENT TANKS WERE REMOVED. I HAD WITNESSED THE CLOSURE AND REMOVAL OF CONTAM. SOILS. 3000 Gallon Tank

PHOTO #2 IS THE AREA WHERE GAS TANKS WERE REMOVED AND REPLACED. THE EXCAVATION HAS NOT BEEN ASPHALTED DUE TO U.C.P. AWAITING FINAL CLOSURE FROM US. IN LOOKING THROUGH THE FILE IT APPEARS THIS TANK FARM HAS BEEN GRANTED FINAL CLOSURE. THE NEW TANKS ARE BEING MONITORED BY A LEAK-ALERT SYSTEM.

ALSO OF INTEREST AT THIS SITE IS THE USE OF DIESEL FUEL AS A RELEASING AGENT IN THE CONCRETE PIPE MOLDS. THE AREA WHERE THIS OPERATION IS HIGHLY SUSCEPTIBLE TO CONTAMINATION. A SITE ASSESSMENT HAS BEEN DONE AND WORK ON THE AREA SHOULD COMMENCE SHORTLY. A WRITTEN REQUEST FOR COPIES OF THE SITE ASSESSMENT MAY BE IN ORDER.

INSPECTOR COPY

WORKERS' COMPENSATION DECLARATION

I hereby affirm that I have a certificate of consent to self insure, or a certificate of Workers' Compensation Insurance, or a certified copy thereof (Sec. 3800, Lab. C.)

Policy No. 37/0027 Company State Comp Insur

☐ Certified copy is hereby furnished.

☐ Certified copy is filed with the county building inspection department.

Date _____ Applicant _____

CERTIFICATE OF EXEMPTION FROM WORKERS' COMPENSATION INSURANCE

(This section need not be completed if the permit is for one hundred dollars ($100) or less.)

I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Workers' Compensation Laws.

Date _____ Applicant _____

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Workers' Compensation provisions of the Labor Code, you must forthwith comply with such provisions or this permit shall be deemed revoked.

LICENSED CONTRACTORS DECLARATION

I hereby affirm that I am licensed under provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.

License Number 278-153 Lic. Class C 39

Contractor Ike's Roof Co. Date 8-6-81

☐ I am exempt from the licensing requirements as I am a licensed architect or a registered professional engineer acting in my professional capacity (Section 7051, Business and Professions Code).

Lic. or Reg. No. _____ Date _____

OWNER-BUILDER DECLARATION

I hereby affirm that I am exempt from the Contractor's License Law for the following reason (Section 7031.5, Business and Professions Code):

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work and the structure is not intended or offered for sale (Section 7044, Business and Professions Code).

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Section 7044, Business and Professions Code).

CONSTRUCTION LENDING AGENCY

I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name _____

Lender's Address _____

I certify that I have read this application and state that the above information is correct. I agree to comply with all County ordinances and State laws relating to building construction, and hereby authorize representatives of this County to enter upon the above-mentioned property for inspection purposes.

APPLICATION FOR BUILDING PERMIT

COUNTY OF LOS ANGELES — **BUILDING AND SAFETY**

WORKER'S COMPENSATION DECLARATION

I hereby affirm that I have a certificate of consent to self insure, or a certificate of Workers' Compensation Insurance, or a certified copy thereof (Sec. 3800, Lab. C.)

Policy No. 11664 Company Pac Rim Ass. Co.

☐ Certified copy is hereby furnished.

☑ Certified copy is filed with the county building inspection department.

Date 9-5-90 Applicant John D Edwards

CERTIFICATE OF EXEMPTION FROM WORKERS' COMPENSATION INSURANCE

(This section need not be completed if the permit is for one hundred dollars ($100) or less.)

I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Workers' Compensation Laws.

Date _____ Applicant _____

NOTICE TO APPLICANT: If, after making this Certificate of Exemption, you should become subject to the Workers' Compensation provisions of the Labor Code, you must forthwith comply with such provisions or this permit shall be deemed revoked.

LICENSED CONTRACTORS DECLARATION

I hereby affirm that I am licensed under provisions of Chapter 9 (commencing with Section 7000) of Division 3 of the Business and Professions Code, and my license is in full force and effect.

License Number 324262 Lic. Class C-21

Contractor J.D. EDWARDS Date 9-5-90

☐ I am exempt under Sec. _____

B.&P.C. for this reason _____

Date: _____

Signature _____

☐ I, as owner of the property, or my employees with wages as their sole compensation, will do the work and the structure is not intended or offered for sale (Section 7044, Business and Professions Code.)

☐ I, as owner of the property, am exclusively contracting with licensed contractors to construct the project (Section 7044, Business and Professions Code.)

CONSTRUCTION LENDING AGENCY

I hereby affirm that there is a construction lending agency for the performance of the work for which this permit is issued (Sec. 3097, Civ. C.).

Lender's Name _____

Lender's Address _____

I certify that I have read this application and state that the above information is correct. I agree to comply with all county ordinances and State laws relating to building construction, and hereby authorize representatives of this County to enter upon the above-mentioned property for inspection purposes.

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Ramboll were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2015. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

Certified Sanborn® Map Report

11/18/21

Site Name:

14005 Live Oak Ave
14005 Live Oak Ave
Baldwin Park, CA 91706
EDR Inquiry # 6756447.3

Client Name:

Ramboll
18100 Von Karman Avenue
Irvine, CA 92612
Contact: Tattiana Mason

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Ramboll were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

FOR TA REALTY ASSOCIATES

1.0 INTRODUCTION

URS Corporation (URS) has prepared this report on behalf of TA Realty Associates and Ralphs Grocery Company that describes the results of a subsurface investigation at the former Hughes Market facility located at 14041 Live Oak Avenue. The planned activities associated with this investigation were outlined in a work plan dated August 10, 2000 (Appendix A). The activities were based on the results of a Phase I Environmental Site Assessment being conducted for the site as part of a "due diligence" evaluation prior to property sale and title transfer. The property owner contact during this phase of investigation was identified as Mr. Tab Harrison of the Ralphs Grocery Company. Mr. Harrison may be contacted by telephone at (310) 884-4083.

2.0 SITE DESCRIPTION

The former Hughes Market facility is located at 14005 East Live Oak Avenue in Irwindale, California. A vicinity map is presented as Figure 1. The site was formerly part of a larger 74-acre parcel (14041 East live Oak Avenue) that was owned and occupied by United Concrete Pipe (UCP). Ralphs Markets acquired Hughes Markets and the property is now considered excess and is in the process of being sold.

The property is located east of the San Gabriel River Channel and south of the Santa Fe Dam. The subject property is bordered to the north-northwest by Rivergrade Road, to the northeast by Arrow Highway, a vacant lot to the east, and south by Live Oak Avenue (Figure 2). The property is developed with a 2-story vacant office building, asphalt parking lots, concrete sidewalks, and landscaped with grass, shrubs and trees.

3.0 GEOLOGY AND HYDROGEOLOGY

The site is situated in the northern-central portion of the San Gabriel Valley Groundwater Basin, overlying fresh water-bearing deposits of that basin. The basin is an elongated, alluvium-filled valley extending from the central part of Los Angeles County almost to its eastern boundary. The valley is approximately 14 miles wide, and is bordered to the north by the San Gabriel Mountains and to the south by the Repetto, Puente, and the San Jose Hills. A topographic divide marks the eastern boundary of the basin, and the Raymond fault serves as the northwestern boundary. The surface area of the valley floor is approximately 100,000 acres.

Average annual precipitation in the site vicinity is approximately 14 inches, although rainfall to the north in the San Gabriel Mountains exceeds 35 inches annually. Because these mountains are composed primarily of non-water-bearing rock, local precipitation from the mountains runs off through the San Gabriel Canyon, providing sources of recharge to the water-bearing deposits underlying the valley floor in the vicinity of the site. The region's groundwater gradient from the mouth of the San Gabriel River is to the south and west.

The principal drainage in the area is the San Gabriel River, located west of the site. The riverbanks are lined with concrete. The river bottom consists of native alluvial sand and gravel deposits.

The surface deposits at the site are recent alluvium deposited in the San Gabriel River flood plain. These deposits overlie older alluvium. The central portion of the San Gabriel Valley Groundwater Basin has water-bearing deposits averaging about 1,000 feet in thickness. The alluvium that comprises the water-bearing materials in the site vicinity consists of randomly sorted, sub-rounded to well-rounded, coarse-grained deposits derived from the San Gabriel Mountains to the north. The deposits range in size from silt to 4-foot diameter boulders. The alluvium generally consists of course sands and gravel, with occasional lenses of finer-grained material deposited during low-flow cycles.

The coarseness of the sands and gravel in the alluvial deposits makes these deposits very efficient aquifers. Horizontal permeability of the deposits range from about 100 to 500 gallons per day per square foot. Vertical permeability is generally an order of magnitude lower than the horizontal values.

Ground water levels in the vicinity of the site fluctuate greatly depending on the frequency and quantity of the precipitation. The existence of a perched water-bearing zone above the primary ground water basin at the site is unlikely, due to the coarse-grained nature of the soil.

4.0 BACKGROUND

In 1991, URS (formerly known as Woodward-Clyde) was retained by Mission-Koll to decommission two 10,000-gallon steel underground storage tanks (USTs) at the former United Concrete Pipe (UCP) facility in Irwindale, California. The USTs consisted of a steel unleaded gasoline tank and a double-walled fiberglass diesel fuel tank. The tanks were removed in April 1991 under Closure Permit No. 7963B issued by the Los Angeles County Department of Public Works (LACDPW). A closure report was submitted to the LACDPW on December 20, 1991. A copy of the closure report (Woodward-Clyde Consultants, Tank Closure Report, December 20, 1991) can be found in Appendix B. LACDPW responded to the closure report with a letter dated March 1995 requesting additional sampling. There is no indication that the former owner has ever responded to this letter, or that a follow-up investigation was ever competed.

URS personnel documented the removal of the tanks and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. Soil samples were taken beneath the tanks at an approximate depth of 15 feet below ground surface (bgs) as specified by the removal permit. Soil samples collected beneath the gasoline tank were analyzed for total petroleum hydrocarbons as gasoline (TPHg) by EPA Method 8015 Modified and the samples collected beneath the diesel tank were analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) by EPA Method 418.1.

The analytical results revealed non-detect concentrations of TPHg in samples collected beneath the unleaded gasoline tank. One sample collected beneath the north end of the diesel tank contained 186 milligrams per kilogram (mg/kg) of TRPH. Additional samples were then collected beneath the diesel tank to assess the magnitude and extent of the TRPH. On May 3, 1991, samples were collected at the same location the TRPH was detected but at greater depths (20 and 25 feet) below grade. The samples taken were non-detect for TRPH but showed low levels of toluene, xylenes, and ethylbenzene.

On May 4, 1991, four additional samples were collected near the area where the original TRPH was detected. All samples were non-detect except for one sample that contained 2 micrograms per kilogram (ug/kg) of toluene. Soil removed from beneath the tank was stockpiled and later moved to another location on site in case further treatment was deemed necessary. The stockpiled soil was reported to show no sign of discoloration.

Hughes Markets acquired a portion of the property from Mission Koll and subsequently developed the property as a business office facility. A two-story office building was constructed over the

location of the former USTs. Currently the office building is unoccupied pending sale of the property.

In July 2000, URS personnel met with Mr. Iheanacho Ofo of LACDPW to discuss specific steps necessary to close the former USTs. In accordance with LACDPW guidelines, Mr. Ofo stated that further soil investigation including sampling for methyl-tertiary-butyl ether (MTBE) must be conducted before closure would be granted. On the basis of LACDPW guidelines, Mr. Ofo stated that five borings around the former UST cluster should be drilled to depths of 40 feet bgs (25 feet below the base of the UST invert) to assess the condition of the subsurface soil. Mr. Ofo stated that if no impacts from petroleum hydrocarbons were detected in the soil beneath the former tanks, then LACDPW would consider granting UST closure.

5.0 PURPOSE AND SCOPE OF SERVICES

The purpose of this investigation was to further investigate subsurface soil conditions to evaluate whether product from the former USTs had impacted deeper soil horizons beneath the site. It should be noted that this phase of work was performed as part of a "due diligence" investigation for a property sale and title transfer and, as such, proceeded without regulatory overview of the August 10, 2000 work plan. The scope of work, however, was intended to fulfill guidelines presented by the LACDPW for a UST Site Assessment Plan with the objective of LACDPW providing regulatory oversight for UST closure. The tasks completed during this investigation are summarized below.

5.1 PREPARATION FOR FIELD INVESTIGATION ACTIVITIES

Prior to conducting the subsurface investigation, URS performed the following activities:

- Prepared a site-specific health and safety plan (HASP) for this phase of work.
- Notified Underground Service Alert of the proposed investigation.
- Selected Oltmans Construction, Spectrum Geophysics, Skaggs Concrete Coring, Pacific Drilling, and Calscience Analytical laboratories as subcontractors for the investigation.

5.2 FIELD-INVESTIGATION ACTIVITIES

The subsurface field investigation included the following activities:

- Conducted an on-site geophysical survey to verify utility clearances before advancing the soil borings.

- Supervised removal and re-construction of interior room walls by licensed contractor in order to provide access for drilling operations.

- Supervised concrete coring and cutting to allow drill stem access through the building foundation in the locations of the five borings.

- Advanced five hollow-stem auger borings to depths of 23 feet bgs, 40.5 feet bgs, 11 feet bgs, 36 feet bgs, and 14 feet bgs.

- Collected soil samples at 4-foot intervals, when possible, from the borings for soil classification, total organic vapor headspace measurements, and chemical analysis.

- Analyzed the soil samples for total petroleum hydrocarbons (TPH - full carbon chain); benzene, toluene, ethylbenzene, and xylenes (BTEX); methyl tertiary butyl ether (MTBE); and lead.

5.3 REPORT PREPARATION

Following the field activities, URS has prepared this summary report with the investigation results and recommendations in accordance with LACDPW guidelines.

6.0 METHODS OF INVESTIGATION

6.1 HEALTH AND SAFETY PLAN

A site-specific HASP was prepared by URS prior to conducting field activities at the site. The HASP described specific health and safety requirements and guidelines for the proposed activities. In addition, URS employees and subcontractor employees assigned to the project attended a tailgate safety meeting given by the Site Safety Officer each day that field activities were performed. A copy of the Health and Safety Plan is included in Appendix C.

6.2 UTILITY CLEARANCE

Underground Service Alert was notified at least 48 hours in advance of the proposed drilling activities. In addition, a geophysical survey was conducted by Spectrum Geophysics prior to performing subsurface work in order to identify the presence of potential utilities or underground structures. Four geophysical methods were used: magnetic; electromagnetic; ground penetrating radar (GPR); and electromagnetic line location. Magnetics and electromagnetics were used to identify underground tanks, drums and conduits. These features are detected due the ferrous and electrically conductive material of their construction. GPR was used as a follow up technology to characterize identified magnetic or electromagnetic anomalies.

An area within an approximate 10-foot radius around each boring location was surveyed. Once a proposed boring location was surveyed and cleared of utilities, the location was re-marked to denote clearance for drilling.

6.3 CONSTRUCTION ACTIVITY

Prior to initiating drilling activities Oltmans Construction, a general contractor, removed part of an exterior wall on the eastern portion of the office building and part of an interior wall in the northern portion of the office building to provide access for the drilling equipment. URS directed the contractor to remove the wall sections. Following completion of drilling activities, the walls and utilities removed were restored to original specifications.

6.4 SOIL BORING ADVANCEMENT

At each boring location, a concrete cutter equipped with a diamond-tipped hole-saw was used to cut two12-inch diameter holes through the concrete surface to expose subsurface soils. Two holes were cut at each boring location to allow for a secondary boring location in case of auger refusal in the primary location. After partially advancing soil boring SB-1, the driller and on-site geologist found it necessary to enlarge the 12-inch diameter holes to allow evacuation of the soil cuttings from the borehole and to allow the drill stem to maneuver around subsurface cobbles/boulders. Therefore, Skaggs Concrete Cutting returned to the site and cut 2' x 4'rectangular shaped holes encompassing the two 12-inch diameter holes.

Five borings, SB-1 through SB-5, were advanced to depths of 23 feet bgs, 40.5 feet bgs, 11 feet bgs, 36 feet bgs, and 14 feet bgs, respectively. Each of the soil borings were advanced until refusal was

met. Refusal of the drill stem was a result of cobble-sized hard rock that could not be penetrated by the drilling equipment. The borings were located in the area of the former dispenser island and USTs as shown on Figure 3. Drilling of the borings was performed using a hollow-stem auger, limited space-drilling rig with 6-inch outside diameter continuous-flight augers. Prior to drilling, boring locations were hand-augured to approximately 5-feet bgs to verify that there were no underground utilities.

Soil samples were collected at 4-foot intervals beginning at 4-feet bgs and continuing every four feet until auger refusal was met. The soil samples were collected using a modified California split-spoon sampler, fitted with three brass liners. The sampler was driven 18 inches (or to refusal) into undisturbed ground, by repeatedly dropping a 140-pound hammer from 30 inches above the sampler. The number of blows required to drive the sampler each 6-inches was recorded on the boring logs shown on Appendix D. Refusal is defined as requiring 50 hammer blows to advance the sampler 6 inches or less. In many instances sampler refusal was met and a sample could not be retrieved. In this case the drill stem was advanced to the next 4-foot interval and sampling continued.

Soil samples were used for measurement of headspace volatile organic compound (VOC) concentrations, describing the soil in accordance with the Unified Soil Classification System (USCS), and for chemical analysis (if selected).

Soil from the middle and top brass liners (if enough soil was available from the sampling process) was placed in a re-sealable plastic bag for approximately 15 minutes to allow VOCs in the soil to volatilize. The soil vapor was then measured by inserting a photoionization detector (PID) probe into the plastic bag. Background VOCs were measured prior to each measurement. The PID results were recorded on the boring logs as shown on Appendix D. The soil samples were visually examined, described and classified in general accordance with the USCS. Soil descriptions were recorded on the boring logs with other pertinent drilling notes.

The bottom brass liner from each sample interval was sealed and capped, labeled, and stored in a chilled cooler for delivery to the laboratory. The drilling and sampling activities were performed under the direction of Mr. Taras B. Kruk, a Registered Geologist (No 5681) and Certified Hydrogeologist (No. 469) experienced in environmental drilling and sampling. Boring logs were prepared in accordance with the URS standard format for environmental drilling. The boring logs

are included in Appendix D and contain geologic descriptions (USCS) of soil strata, sample identification numbers, blow counts, and PID readings for headspace analyses.

During drilling activities, soil cuttings were shoveled into 55-gallon drums. The drums were labeled, identifying the site name, boring number, date, and properly sealed. The soil cuttings will be disposed of in an appropriate manner.

6.5 SOIL ANALYSIS

Soil samples collected from the borings were submitted to Calscience Environmental Laboratories, Inc. (Calscience) in Garden Grove, California for analyses. Soil samples collected as feasibly close to 8, 16, 24, 32 and 40 feet were analyzed for TPH by EPA Method 8015-Modified for carbon chain to C44 and BTEX/MTBE by EPA Method 8020. Soil samples collected as feasibly close to 32 and 40 feet were additionally analyzed for lead by EPA Method 6010B. Samples not selected for analysis were held by the laboratory in the event that additional analysis was needed to confirm a "clean" zone beneath the former USTs. All samples sent to the laboratory were sealed, labeled, stored in a chilled cooler and submitted in accordance with EPA chain-of-custody field procedures. Soil samples were analyzed by Calscience on a 24-hour turn around time. It should be noted that the samples collected were not analyzed for TRPH by EPA Method 418.1 since the former USTs did not contain motor oil.

6.6 DECONTAMINATION PROCEDURES

The drill rig and augers were decontaminated by steam cleaning at the drilling company's maintenance facility prior to arriving at the site. The drilling company provided enough clean equipment for each day of drilling and sampling. They also provided a mobile steam cleaner for field decontamination of augers, and other large equipment used for drilling and/or sampling. Only properly decontaminated equipment approved by URS onsite personnel was used for drilling and sampling.

The field decontamination process for smaller (non-disposable) soil sampling equipment (i.e., split spoon sampler) consisted of wiping the equipment of excess soil, washing in a solution of non-phosphate detergent (Liquinox), and rinsing twice with de-ionized water. The equipment was cleaned prior to use, between each sample collection, and prior to leaving the site. All decontamination liquid and soil cuttings generated from drilling operations were stored in a

55-gallon Department of Transportation (DOT) approved drums, labeled, and properly sealed. URS staged the drums in the former trash dumpster area for disposal.

6.7 QUALITY ASSURANCE SAMPLES

Laboratory QA/QC samples were analyzed to identify the precision and accuracy of the laboratory measurements. Laboratory QA/QC samples consist of method blanks and matrix spike/matrix spike duplicates (MS/MSD) that are run daily as part of the laboratory's QA/QC plan. The purpose of the method blank samples is to evaluate the potential for introduction (during laboratory sample handling) of an analyte into a sample extract that is not present at detectable levels in the sample matrix. The purpose of the MS/MSD samples is to evaluate the effects of the sample matrix on the measurement methodology.

6.8 SAMPLE DOCUMENTATION AND TRACKING

Documentation of observations and data acquired in the field provide information on the acquisition of samples and also provide a permanent record of field activities. The observations and data were recorded with indelible ink on field sampling data sheets.

The information on the field sampling data sheets included the following information:

- Project name;
- Location of sample;
- Sampler's signature;
- Date and time of sample collection;
- Sample identification numbers and sample depth (if applicable);
- Description of samples (matrix sampled);
- Analysis to be performed;
- Number and volume of samples;
- Sample methods;
- Sample handling;
- Field observations; and
- Personnel and equipment present.

Changes or deletions on the field sampling data sheets were lined out with a single strike mark, initialed and dated by the person making the change, and remained legible. Sufficient information

was recorded to allow the sampling event to be reconstructed without relying on the collector's memory.

7.0 INVESTIGATIVE RESULTS

Five soil borings were advanced inside the former Hughes Market facility located at 14041 Live Oak Avenue, Irwindale, California during the time from August 14 through August 17, 2000. Boring SB-1 was drilled adjacent and south of the former underground storage tank (UST) and dispenser island location. Boring SB-2 was drilled through the approximate center of the former UST cluster location. Boring SB-3 and SB-4 were advanced adjacent and southwest, and adjacent and west, of the former UST and dispenser island location, respectively. Boring SB-5 was advanced north of the former UST and dispenser island location. The boring locations are shown on Figure 3.

The presence of cobbles resulted in difficult drilling conditions and, as such, four of the five boreholes met refusal before reaching the targeted depth of 40 feet bgs. However, URS used the best available technology (BAT) in attempting the 40-foot target depth within the former UST and dispenser island area, which we believe fulfill the regulatory requirements.

Boring SB-1 was advanced to a total depth of 23 feet bgs on the third attempt. Refusal was encountered twice at 6 feet bgs and finally at 23 feet bgs in the third location. Boring SB-1 encountered dark brown, fine sand, with coarse gravel at four feet bgs. Numerous cobble-sized rocks created refusal conditions for the split-spoon sampler at the 8-, 12-, and 16-foot depths. Brown/ greenish-gray, coarse, gravelly sand was encountered at 20 feet bgs, and drill rig refusal was met at 23 feet bgs due most probably to a boulder-sized rock. Headspace readings of the soil samples collected ranged from 9.8 to 15.2 ppm.

Boring SB-2 was advanced to a total depth of 40.5 feet bgs on the first attempt. Refusal was encountered at 40.5 feet bgs; however, the target depth set forth in the Soil Boring Investigation Workplan of 40 feet bgs was attained. Boring SB-2 encountered dark brown, gravelly, fine to coarse sand at 4 feet bgs. A cobble-sized rock created refusal conditions for the split-spoon sampler at the 8, 16-, and 20-foot depths. Light gray, gravelly, medium to coarse sand, with cobble sized fragments were encountered at 12 feet bgs. Brown, fine to coarse sand, with coarse gravel was observed in the 24-foot sample. Brown, fine to medium, sandy, gravel was encountered at 28 feet bgs while refusal of the sampler occurred at 32 feet. Olive gray/brown, gravelly, medium to coarse, sand with chips from cobble-sized rock was observed in the 36-foot sample. Sampler refusal was encountered at the 40-foot depth and eventually drill rig refusal at 40.5 feet bgs due to a cobble or boulder. Headspace readings of the soil samples collected from this borehole ranged from 1.8 to 3.4 ppm.

Boring SB-3 was advanced to a total depth of 11 feet bgs on the second attempt. Refusal was encountered once at 5 feet bgs and finally at 11 feet bgs in the second location. Boring SB-3 encountered sampler refusal at 4 feet bgs due to a granitic cobble fragment in the shoe of the sample barrel. Brown/greenish gray, fine to coarse, gravelly, sand was encountered at 8 feet bgs. Drill rig refusal occurred at 11 feet bgs in SB-3 due most probably to a cobble sized rock. The headspace reading of the soil sample collected from this borehole was 1.6 ppm.

Boring SB-4 was advanced to a total depth of 36 feet bgs on the first attempt. Boring SB-4 encountered dark brown, medium to coarse, sand, with fine gravel at 4 feet bgs, gray/greenish gray, gravel-sized, granitic, rock chips, with medium to coarse sand at 8 feet bgs, and brown, fine to coarse, sand, with fine gravel at 12 feet bgs. A cobble-sized rock created refusal conditions for the split spoon sampler at the 16-foot depth. Light brown/brown, fine to coarse sand with fine gravel was encountered at 20 and 24 feet bgs. Sampler refusal occurred at the 28- and 36-foot depths. Brown, medium to coarse sand with fine gravel was observed in the 32-foot sample. Drill rig refusal occurred at 36 feet bgs due most probably to a cobble-sized rock. Headspace readings of the soil samples collected from this borehole ranged from 1.5 to 14.3 ppm.

Boring SB-5 was advanced to a total depth of 14 feet bgs on the second attempt. Refusal was encountered once at 12 feet bgs and finally at 14 feet bgs in the second location. Boring SB-4 encountered dark brown, fine to coarse, sand, with fine gravel at 4 feet and 8 feet bgs. Sampler refusal was encountered at 12 feet bgs due to a cobble. Drill rig refusal occurred at 14 feet bgs in SB-5 due most probably to a cobble sized rock. Headspace readings of the soil samples collected from this borehole ranged from 10.3 to 22.4 ppm.

URS submitted the 20-foot sample from boring SB-1, the 24-foot and 36-foot samples from boring SB-2, the 8-foot sample from boring SB-3, the 8-, 24-, and 32-foot samples from SB-4, and the 8-foot sample from boring SB-5 to Calscience Environmental Laboratories, Inc. for analyses. In accordance with LACDPW guidelines, soil samples were analyzed for Total Petroleum Hydrocarbons (TPH) by EPA Method 8015-modified for carbon chain matches through C44; the volatile fuel hydrocarbon constituents BTEX by EPA 8020; and the fuel additive MTBE by EPA Method 8020. Soil samples collected as feasibly close to 32 and 40 feet were additionally analyzed for lead by EPA Method 6010B. The soil samples were analyzed on a 24-hour turnaround basis. Samples that were not selected for analysis were held by the laboratory in the event additional analyses were needed to confirm a "clean" zone beneath the former USTs. Laboratory reports and chain-of-custody records are presented in Appendix E.

PID measurements ranged from 1.5 to 22.4 parts per million by volume (ppmv). The results of TPH, BTEX, and MTBE analyses were all below method detection limits and total lead concentrations ranged from 1.35 mg/kg in SB-4 to 5.42 mg/kg in SB-1. Results of the findings are summarized in Table 1.

8.0 CONCLUSIONS AND RECOMMENDATIONS

Results of the field monitoring indicated the presence of some residual hydrocarbons in vapor-phase as measured by the PID. Results of the laboratory analyses, however, showed no indication of petroleum hydrocarbons remaining in the soil. The analytical results for lead indicated that concentrations are indicative of background lead levels in soil for the State of California (9.0 ppm to 31.0 ppm) according to the Kearney Foundation's "Special Soil Report," dated March, 1996. Based on these results, it is our opinion that no further action is required for this UST site and that formal case closure should be issued.

Alhambra, CA 91803-1331

Re: Work Plan and Check Submittal for
Voluntary Cleanup Oversight
UST Closure Investigation
Irwindale Office Building
14005 Live Oak Avenue
Irwindale, California
URS/D&M Job No. 25437-160-149

Dear Mr. Ofo:

Please find attached, a Work Plan for a Soil Boring Investigation, and a check amounting to $535 ($401 "initial fee" and $135 one hour "maximum billed oversight fee") for entering into the Voluntary Cleanup Oversight program. These submittals are being made pursuant to our August 2, 2000 meeting at your office.

As you are aware, URS Corporation (formerly as Dames & Moore) is performing a Phase I Environmental Site Assessment for TA Realty Associates as part of a "due diligence" evaluation prior to property sale and title transfer. The current property owner contact is as follows:

Mr. Tab Harrison
Director of Environmental Affairs
Ralphs Grocery Company
P.O. Box 54143
Los Angeles, CA 90054
Phone: (310) 884-4083
FAX: (310) 884-2508

The objective of the upcoming soil boring investigation described in the attached work plan is to further investigate subsurface soil conditions and evaluate whether product from former underground storage tanks (USTs) had impacted deeper soil horizons beneath the site. It should be noted that, per our earlier discussions, this phase of work is being performed as part of a "due diligence" investigation for the property sale and title transfer and, as such, is proceeding without regulatory overview of the attached work plan. The scope of work, however, is intended to

fulfill guidelines presented by the Los Angeles County Department of Public Works (LACDPW) for a UST Site Assessment Plan with the objective of LACDPW providing regulatory oversight for UST closure. It should also be noted that the scope of work includes recent revisions that incorporate your suggestions made during our August 2, 2000 meeting.

We look forward to working with you on this project. Please feel free to contact me at (714) 433-7694 if you have any questions or comments.

Respectfully Submitted,

URS Corporation

Taras B. Kruk, R.G., C.HG.
Senior Geologist

w/Attach.

cc: Mr. Jim Buckingham, TA Realty Associates
Mr. Tab Harrison, Ralphs Grocery Company
Mr. Jeff Darling, URS Corporation/KS

LIST OF APPENDICES

A TASK CLOSURE REPORT (Dated December 20, 1991)

URS Corporation (URS) has been retained on behalf of TA Realty Associates and Ralphs Grocery Company to conduct a subsurface investigation at the former Hughes Market facility located at 14041 Live Oak Avenue. The proposed activities associated with this investigation are outlined below in this work plan. The activities are based on the results of an ongoing Phase I Environmental Site Assessment being conducted for the site as part of a "due diligence" evaluation prior to property sale and title transfer. The current property owner contact is identified as Mr. Tab Harrison of Ralphs Groceries. Mr. Harrison may be contacted by telephone at (310) 884-4083.

1.1 BACKGROUND

In 1991, URS was retained by Mission-Koll to decommission two 10,000-gallon steel underground storage tanks (USTs) at the former United Concrete Pipe (UCP) facility in Irwindale, California. The USTs consisted of a steel unleaded gasoline tank and a double-walled fiberglass diesel fuel tank. The tanks were removed in April 1991 under Closure Permit No. 7963B issued by the Los Angeles County Department of Public Works (LACDPW). A closure report was submitted to the LACDPW on December 20, 1991. A copy of the closure report (Woodward-Clyde Consultants, Tank Closure Report, December 20, 1991) can be found in Appendix A. LACDPW responded to the closure report with a letter dated March 1995 requesting additional sampling. There is no indication that the former owner has ever responded to this letter, or that a follow-up investigation was ever competed.

Hughes Markets acquired a portion of the property from Mission Koll and subsequently developed the property as a business office facility. A two-story office building was constructed over the location of the former USTs. Currently the office building is unoccupied pending sale of the property.

In July 2000, URS personnel met with Mr. Iheanacho Ofo of LACDPW to discuss the specific steps necessary to close the former USTs. In accordance with LACDPW guidelines, Mr. Ofo stated that further soil investigation including sampling for methyl-tertiary-butyl ether (MTBE) must be conducted before closure would be granted. The guidelines require five borings around the former UST cluster to depths of 40 feet below ground surface (bgs) (25 feet below the base of the UST invert) to assess the condition of the subsurface soil. Mr. Ofo stated that if no impacts from petroleum hydrocarbons were detected in the soil beneath the former tanks then LACDPW would consider granting UST closure.

1.2 OBJECTIVES

The objective of the investigation described in this work plan is to further investigate subsurface soil conditions to evaluate whether product from former USTs had impacted deeper soil horizons beneath the site. It should be noted that this phase of work is being performed as part of a "due diligence" investigation for a property sale and title transfer and, as such, is proceeding without regulatory overview of this work plan. The scope of work, however, is intended to fulfill guidelines presented by the LACDPW for a UST Site Assessment Plan with the objective of LACDPW to provide regulatory oversight for UST closure.

1.3 APPROACH

URS has proposed the following approach to meet the objective of the investigation:

- Perform tasks necessary to initiate field investigation
- Advance five soil borings to 40 bgs in the location of the former gasoline dispenser island and USTs to collect additional soil samples for analytical testing.
- Submit collected soil for appropriate analytical tests.
- Prepare a report describing the field activities and results of laboratory analyses.

1.4 SCOPE OF WORK

The scope of work necessary to meet the objective and approach of the investigation are outlined below, and described in detail in Sections 3 and 4.

1.4.1 Task 1: Preparation for Field Investigation Activities

Prior to conducting the subsurface investigation, URS will perform the following activities:

- Prepare/update the site-specific health and safety plan (HASP) for this phase of work.
- Notify Underground Service Alert of proposed investigation.
- Select construction, geophysics, concrete coring, drilling and analytical laboratory subcontractors.

1.4.2 Task 2: Field-Investigation Activities

The subsurface field investigation will include the following activities:

- Conduct site geophysical survey to verify utility clearances before beginning intrusive investigations.
- Supervise removal and re-construction of interior room walls by licensed contractor in order to provide access for drilling operations.
- Complete five hollow-stem auger borings to be advanced to 40 feet bgs.
- Collect soil samples at 5-foot intervals from the vadose zone during drilling of borings for soil classification, total organic vapor headspace measurements, and chemical analysis.
- Analyze the soil samples for total petroleum hydrocarbons (TPH - full carbon chain); benzene, toluene, ethylbenzene, and xylenes (BTEX); MTBE; and lead.

1.4.3 Task 3: Report Preparation

Following the field activities, URS will prepare a summary report with the investigation results and recommendations. In accordance with LACDPW guidelines, the report will include the following:

- Site information
- Facility maps
- Geology/Hydrogeology
- Boring logs
- Field sampling procedures
- Chain-of-custody records
- Laboratory results
- Waste management documentation
- Subsurface plume illustrations
- Conclusions and recommendations
- References

2.1 SITE DESCRIPTION

The former Hughes Market facility is located at 14005 East Live Oaks Avenue in Irwindale, California (Figure 1). The site was formerly part of a larger 74-acre parcel (14041 East live Oak Avenue) that was owned and occupied by United Concrete Pipe (UCP). Ralphs Markets acquired Hughes Markets and the property is now considered excess and is in the process of being sold.

The property is located east of the San Gabriel River Channel and south of the Santa Fe Dam. Rivergrade Road borders the subject property to the north-northwest, to the northeast by Arrow Highway, a vacant lot to the east and south by Live Oak Avenue (Figure 2). The property is developed with a 2-story vacant office building, asphalt parking lots, concrete sidewalks, and landscaped with grass, shrubs and trees.

2.1 GEOLOGY AND HYDROGEOLOGY

The site is situated in the north-central portion of the San Gabriel Valley Groundwater Basin, overlying fresh water-bearing deposits of that basin. The basin is an elongated, alluvium-filled valley extending from the central part of Los Angeles County almost to its eastern boundary. The valley is approximately 14 miles wide, and is bordered to the north by the San Gabriel Mountains and to the south by the Repetto, Puente, and the San Jose Hills. A topographic divide marks the eastern boundary of the basin, and the Raymond fault serves as the northwestern boundary. The surface area of the valley floor is approximately 100,000 acres.

Average annual precipitation in the site vicinity is approximately 14 inches, although rainfall to the north in the San Gabriel Mountains exceeds 35 inches annually. Because these mountains are composed primarily of non-water-bearing rock, local precipitation from the mountains runs off through the San Gabriel Canyon, providing sources of recharge to the water-bearing deposits underlying the valley floor in the vicinity of the site. The region's groundwater gradient from the mouth of the San Gabriel River is to the south and west.

The principal drainage in the area is the San Gabriel River, located west of the site. The riverbanks are lined with concrete. The river bottom consists of native alluvial sand and gravel deposits.

The surface deposits in the site are recent alluvium deposited in the San Gabriel River flood plain. These deposits overlie older alluvium. The central portion of the San Gabriel Valley Groundwater Basin has water-bearing deposits averaging about 1,000 feet in thickness. The

alluvium that comprises the water-bearing materials in the site vicinity consists of randomly sorted, subrounded to well-rounded, course-grained deposits derived from the San Gabriel Mountains to the north. The deposits range in size from silts to 4-foot diameter boulders. The alluvium generally consists of course sands and gravel, with occasional lenses of finer-grained material deposited during low-flow cycles.

The coarseness of the sands and gravel in the alluvial deposits makes these deposits very efficient aquifers. Horizontal permeability of the deposits range from about 100 to 500 gallons per day per square foot. Vertical permeability is generally an order of magnitude lower than the horizontal values.

Ground water levels in the vicinity of the site fluctuate greatly depending on the frequency and quantity of the precipitation. The existence of a perched water-bearing zone above the primary ground water basin at the site is unlikely, due to the coarse-grained nature of the soil.

2.2 SUMMARY OF PREVIOUS SITE INVESTIGATIONS

URS (formerly Woodward-Clyde) conducted a previous field investigation that consisted of the removal of two USTs at 14041 East Live Oaks Avenue in Irwindale, California. The field investigation was conducted on April 23, 1991. The two tanks consisted of a 10,000-gallon steel (unleaded) gasoline tank and a 10,000-gallon double-walled fiberglass diesel tank. A copy of the tank removal report can be found in Appendix A.

URS personnel documented the removal of the tanks and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. Soil samples were taken beneath the tanks at an approximate depth of 15 feet bgs as specified by the removal permit. Soil samples collected beneath the gasoline tank were analyzed for total petroleum hydrocarbons as gasoline (TPHg) by EPA Method 8015 Modified and the samples collected beneath the diesel tank were analyzed for Total Recoverable Petroleum Hydrocarbons (TRPH) by EPA Method 418.1.

The analytical results revealed non-detect concentrations of TPHg in samples collected beneath the unleaded gasoline tank. One sample collected beneath the north end of the diesel tank contained 186 milligrams per kilogram (mg/kg) of TRPH. Additional samples were then collected beneath the diesel tank to assess the magnitude and extent of the TRPH. On May 3, 1991, samples were collected at the same location the TRPH was detected but at greater depths (20 and 25 feet) below grade. The samples taken were non-detect for TRPH but showed low levels of toluene, xylenes, and ethylbenzenes.

On May 4, 1991, four additional samples were collected near the area were the original TRPH was detected. All samples were non-detect except for one sample that contained 2 micrograms per kilogram (ug/kg) of toluene. The soil removed beneath the tank for soil collection was stockpiled and later moved to another location on site in case further treatment was deemed necessary. The stockpiled soil was reported to show no sign of discoloration.

This section presents a discussion of pre-field activities to be conducted prior to beginning field investigation activities described in Section 4.0.

3.1 HEALTH AND SAFETY PLAN

A site-specific HASP will be prepared by URS prior to conducting field activities at the site. The HASP will describe specific health and safety requirements and guidelines for the proposed activities. In addition, URS employees and subcontractor employees assigned to the project will attend a tailgate safety meeting given by the Site Safety Officer each day that field activities are performed.

3.2 UNDERGROUND UTILITY SURVEY

Underground Service Alert will be notified at least 48 hours in advance of the proposed drilling activities. In addition, a geophysical survey will be conducted prior to performing subsurface work in order to identify the presence of potential utilities or underground structures. Four potential methods may be used: magnetic; electromagnetic; ground penetrating radar (GPR); or electromagnetic line location. Magnetics and electromagnetics are used to identify underground tanks, drums and conduits. These features are detected due the ferrous and electrically conductive material of their construction. GPR is used as a follow up technology to characterize identified magnetic or electromagnetic anomalies.

An area within an approximate 10-foot radius around the boring location will be surveyed. Once a proposed boring location is surveyed and cleared of utilities, the location will be remarked to denote clearance for drilling. If utilities are detected within the surveyed area, marking in paint on the ground will denote type of utility detected (e.g., electrical conduits) and the approximate location.

3.3 CONSTRUCTION ACTIVITY

Prior to initiating drilling activities a general contractor will remove appropriate building walls to provide access to for the drilling equipment to access the boring locations. URS will direct the contractor to the wall sections to be removed. Following completion of drilling activities the walls and utilities removed will be restored to original specifications.

This section presents a description of field activities to be performed during the site investigation.

4.1 SOIL BORING ADVANCEMENT

At each boring location, a concrete coring device equipped with a diamond-tipped circular concrete corer will be used to advance through the concrete surface.

Five borings (SB-1 through SB-5) will be advanced to a depth of 40 feet bgs or until refusal is met. The borings will be located in the area of the former dispenser island and USTs (Figure 3). Drilling of the borings will be performed using a hollow stem auger, limited space drilling rig with 6-inch outside diameter continuous-flight augers. Prior to drilling, boring locations will be hand-augured to approximately 5 feet bgs to verify that there are no underground utilities.

Soil samples will be collected at approximately 4-foot intervals beginning at 4-feet bgs and continuing to 40 feet bgs. The soil samples will be collected using a modified California split-spoon sampler, fitted with three brass liners. The sampler will be driven 18 inches (or to refusal) into undisturbed ground, by repeatedly dropping a 140-pound hammer from 30 inches above the sampler. The number of blows required to drive the sampler each 6 inches will be recorded. Refusal will be defined as requiring 50 hammer blows to advance the sampler 6 inches or less.

Soil samples will be used for measurement of head space volatile organic compound (VOC) concentration, describing the soil in accordance with the Unified Soil Classification System (USCS), and for chemical analysis (if selected).

Soil from the middle and top brass liners will be placed in a resealable plastic bag for approximately 15 minutes to allow VOCs in the soil to volatilize. The soil vapor will then be measured by inserting an organic vapor analyzer (OVA) or photoionization detector (PID) probe into the plastic bag. Background VOCs will be measured prior to each measurement. The organic vapor monitoring results will be recorded on boring logs.

The soil samples will be visually examined, described and classified in general accordance with the USCS. Soil descriptions will be recorded on the boring logs with other pertinent drilling notes.

The bottom brass liner from each sample interval will be sealed and capped, labeled, and stored in a chilled cooler for delivery to the laboratory.

A Registered Geologist or Professional Engineer experienced in environmental drilling and sampling will perform oversight of the drilling and sampling program. Boring logs will be prepared in accordance with the URS standard format for environmental drilling. At a minimum, boring logs shall contain geologic descriptions (USCS) of soil strata, depth to groundwater if encountered, depth to free product if present, sample identification numbers, blow counts, and OVA readings for headspace analyses. A Registered Geologist will review the boring logs.

During drilling activities, soil cuttings will be shoveled into 55-gallon drums. The drums will be labeled, identifying borings and depth intervals, and properly sealed or secured. Following a review of analytical soil tests the soil cuttings will be disposed at an appropriate licensed facility.

4.2 SOIL ANALYSIS

All soil samples collected from the borings will be submitted to Calscience Environmental Laboratories, Inc. (Calscience) in Garden Grove, California for analytical analyses. Soil samples collected 8, 16, 24, 32 and 40 feet will be analyzed for TPH analysis by EPA Method 8015-Modified for carbon chain to C44 and BTEX/MTBE using EPA Method 8020. Soil samples collected at 32 and 40 feet will be additionally analyzed for lead by EPA Method 6010B. Samples not selected for analysis (4, 12, 20, 28 and 36 feet) will be held by the laboratory in the event additional analysis is needed to confirm a "clean" zone beneath the former USTs. Samples showing detectable concentrations of MTBE will be confirmed by EPA Method 8260. All samples sent to the laboratory will be sealed, labeled, stored in a chilled cooler and submitted in accordance with EPA chain-of-custody field procedures. Soil samples will be analyzed by Calscience on a 24-hour turn around time. It should be noted that samples collected will not be analyzed for TRPH by EPA Method 418.1 since the former USTs did not contain motor oil.

4.3 DECONTAMINATION PROCEDURES

Drill rigs and augers will be decontaminated by steam cleaning at the drilling company's maintenance facility prior to arriving at the site. The drilling company will provide enough clean equipment for each day of drilling and sampling. They will also provide a mobile steam cleaner for field decontamination of augers, and other large equipment used for drilling and/or sampling. Only properly decontaminated equipment approved by URS Greiner Woodward Clyde onsite personnel will be used for drilling and sampling.

The field decontamination process for smaller (non-disposable) soil sampling equipment (i.e., split spoon sampler), will consist of wiping the equipment of excess soil, washing in a solution of

non-phosphate detergent (Liquinox), and rinsing with deionized water. The equipment will be cleaned prior to use, between each sample collection, and prior to leaving the site. All decontamination liquid and soil cuttings generated from drilling operations will be stored in 55-gallon Department of Transportation (DOT) approved drums, labeled, and properly sealed or secured. URS will stage the drums in an appropriate designated area for disposal.

4.4 QUALITY ASSURANCE SAMPLES

Laboratory QA/QC samples will be analyzed to identify the precision and accuracy of the laboratory measurements. Laboratory QA/QC samples consist of method blanks and matrix spike/matrix spike duplicates (MS/MSD) that are run daily as part of the laboratory's QA/QC plan. The purpose of the method blank samples is to evaluate the potential for introduction (during laboratory sample handling) of an analyte into a sample extract that is not present at detectable levels in the sample matrix. The purpose of the MS/MSD samples is to evaluate the effects of the sample matrix on the measurement methodology.

4.5 SAMPLE DOCUMENTATION AND TRACKING

Documentation of observations and data acquired in the field will provide information on the acquisition of samples and also provide a permanent record of field activities. The observations and data will be recorded with indelible ink in a permanently bound weatherproof field book with consecutively numbered pages and, if applicable, on field sampling data sheets.

The information in the field book will include the following as a minimum.

- Project name
- Location of sample
- Sampler's signature
- Date and time of sample collection
- Sample identification numbers and sample depth (if applicable)
- Description of samples (matrix sampled)
- Analysis to be performed
- Number and volume of samples
- Description of QA/QC samples (if collected)
- Sample methods

- Sample handling
- Field observations
- Personnel and equipment present

Changes or deletions in the field book should be lined out with a single strike mark, initialed and dated by person making change, and remain legible. Sufficient information should be recorded to allow the sampling event to be reconstructed without relying on the collector's memory.

URS will prepare a report of investigation following completion of field activities and laboratory analyses. The report will include a description of field activities, a summary of laboratory results in text and tabular format, conclusions and recommendations, site figures, boring logs, laboratory reports and chain-of-custody documentation, and QA/QC documentation.

Los Angeles County Department of Public Works
900 South Fremont
Alhambra, California 91802

Atten: Waste Management Division

SUBJECT: TANK CLOSURE REPORT
FILE NUMBER 593, PERMIT NUMBER 7963

Dear Mr. Sjoberg,

On behalf of Mission-Koll I (Koll), Woodward-Clyde Consultants (Woodward-Clyde) is submitting this report regarding the removal of two underground storage tanks at 14041 East Live Oaks Avenue, Irwindale, California (Figure 1). This report addresses the items listed in the Los Angeles County Department of Public Works closure report checklist (Attachment A). The two tanks consisted of a 10,000 gallon steel (unleaded) gasoline tank and a 10,000 gallon double-walled fiberglass diesel tank. Figure 2 shows the locations of the tanks.

The tanks were removed on April 23, 1991 in accordance with conditions specified in permit number 7963, file number 593. The general contractor for the removal was J. D. Edwards at 11711 Clark Street, Unit 110, Arcadia, California 91006. They employed the following additional subcontractors:

- Nieto & Sons Trucking, Inc., Brea, California
  (cleaned tanks and hauled and disposed of liquid waste)
- CTL Environmental Services, Harbor City, California
  (Certified Industrial Hygienist)
- Western Tank Testing, 22911 Savi Ranch Parkway, Yorba Linda, California (Degassed fuel tank)

Woodward-Clyde personnel documented the removal of the tank and collected soil samples to evaluate whether the soil under the tanks had been impacted by petroleum hydrocarbons. During the tank removal activities, the air in and around the tank excavation was monitored for volatile organics with an organic vapor analyzer (OVA). Most of the readings were near background (1.5 ppm) with two exceptions. Two readings were taken when a gasoline odor was noticed that registered > 100 ppm. These readings were obtained prior to tank de-gassing and seemed to be due to wind blowing

the vapors from the tanks. The tanks were pumped, de-gassed and certified "clean" by a certified industrial hygienist, and were then transported to American Metal Recycling, Inc. 2202 South Milliken Avenue, Ontario, California for disposal. Documentation of the removal, certification, and proper disposal of the tanks is included in Attachment B.

Soil samples were collected beneath the ends of the tanks (at an approximate depth of 15 feet below grade) as specified in the removal permit. The samples were collected by using a backhoe to excavate soil from the desired depth, and then collecting a sample from the bucket of the backhoe, using a spatula. The samples were grab samples (no borings were drilled), and were collected within one half hour after the tanks were removed (between 2:15 and 2:45 pm). They were stored on ice and transported with chain-of-custody documentation to West Coast Analytical Services, Inc. for analysis for total petroleum hydrocarbons (TPH) and for volatile aromatic hydrocarbons by EPA Method 8020. The samples from beneath the gasoline tank were analyzed for TPH by EPA Method 8015 (modified), and the samples from beneath the diesel tank were analyzed for TPH by EPA Method 418.1. Laboratory reports and chain-of custody forms are included in Attachment C.

The analytical results revealed non-detect concentrations of TPH for all samples except for sample 1B, collected beneath the north end of the diesel tank, which contained 186 mg/kg of TPH. Low concentrations of toluene, ethylbenzene and xylenes were detected in three of the four samples. These compounds were also detected in similar concentrations in the lab blanks, indicating that their presence was due to laboratory contamination.

Given the detection of TPH beneath the north end of the diesel tank, Woodward-Clyde personnel collected additional samples to assess the magnitude and extent of the TPH. On May 3 1991, samples were collected at the same location as sample 1B, but at greater depths (20 and 25 feet) below grade. These samples were collected as described above, and were transported with accompanying chain-of-custody documentation to West Coast Analytical Service, Inc. for analysis for TPH by EPA Method 418.1, and for volatile aromatic hydrocarbons by EPA Method 8020. Both samples were non-detect for TPH. Low levels of toluene and xylenes were detected in the samples as well as in the lab blank, and 2 ug/kg of ethylbenzene was detected in sample T-20B.

On May 9 1991, four additional samples were collected. Samples 1B-N1, 1B-S1, 1B-W1 and 1B-E1 were collected 2 to 5 feet north, south, west and east, respectively, of the original sample 1B. These samples were collected as described above, and were transported with accompanying chain-of-custody documentation to West Coast Analytical Service for analysis for TPH by EPA Method 418.1, and for volatile aromatic hydrocarbons by EPA Method 8020. All of the samples were non-detect for the target compounds with the exception of sample 1B-W1 which contained 2 ug/kg of toluene.

The soil that was removed beneath the north end of the diesel tank for sample collection was stockpiled near the tank excavation. On May 15 1991, when the excavation was backfilled, this soil was transported to another location on the site in case further treatment was deemed necessary. This soil had no odor or discoloration.

CERTIFICATION

I have reviewed this report and declare that the information included herein is true and accurate and complete to the best of my knowledge.

Public Records Request Number: PR3-120221-07

Location: 14041 E. Live Oak Ave., Irwindale CA 91706

Dear Ms. Eckelman:

On December 2, 2021, the Department of Toxic Substances Control (DTSC) received your email of the same date requesting records under the Public Records Act. DTSC Chatsworth has identified site records responsive, has scanned them to two PDFs and has attached them to the email that accompanies this response letter. The records on the PDFs – with two exceptions – represent our complete file on this site. The exceptions are:

- A preliminary draft of DTSC's June 13, 1990, letter – with PEA Review Comments – to Alistaire Callender of Woodward-Clyde Consultants. See pages 33-35 of the smaller PDF. (As it turned out, those three pages are word-for word copies of the draft.)
- A Preliminary Endangerment Assessment checklist used by DTSC to prepare the documents described above. Each page of this checklist was footnoted 'Draft 12/22/89'.

Since both of the above are DTSC-originated drafts, they fall under item (1) of the footnote at the end of this letter and must be withheld.

DTSC's Hazardous Waste Tracking System (HWTS) may also have records that pertain to this request. This unit tracks toxic waste generators, transporters (manifests), and disposal facilities. If you are interested in this type of information, it can be identified by accessing the HWTS database at http://hwts.dtsc.ca.gov. If you are interested in

retrieving detailed reports, additional charges may apply. Please contact the HWTS unit by email at hwtsreports@dtsc.ca.gov or by phone at (800) 618-6942 for further information. For copies of manifests, please send an email to mcr@dtsc.ca.gov.

Many of our records are available on EnviroStor, an online database that provides non-confidential, public access to DTSC's data management system. It tracks our cleanup, permitting, enforcement, and investigation efforts at hazardous waste facilities and sites with known or suspected contamination issues. EnviroStor is available 24/7, 365 days a year. The data reflects the latest updates as they are entered in the system. Access it from your computer or smartphone, the local library – anywhere Internet access is available. Just go to www.envirostor.dtsc.ca.gov. You'll find a step-by-step tour of EnviroStor under the "How to Use EnviroStor" menu on the website.

If you have any questions or would like further information regarding your request, please contact me at 818-717-6521 or via email at ChatsworthFileRoom@dtsc.ca.gov.

Respectfully,

Robert Hardison
Records Mgmt. Asst. Coordinator

[i] Some of the records may be exempt from disclosure under the Public Records Act because they may be identified as follows: (1) preliminary drafts or notes (Government Code sections 6254(a)); (2) records pertaining to pending litigation (Government Code section 6254(b)); (3) personnel, medical, personal or private information (Government Code sections 6254(c), 6254(k), 6254.3; Civil Code section 1798, et seq.); (4) records pertaining to complaints or investigations or identification of confidential informant(Government Code section 6254(f)); (5) records covered by the attorney-client privilege (Government Code section 6254(k); Evidence Code section 954); (6) records covered by the attorney work product privilege (Government Code section 6254(k); Code of Civil Procedure section 2018.030); (7) records covered by the deliberative process privilege (Government Code sections 6254(k), 6255; Times Mirror Company v. Superior Court (1991) 53 Cal. 3d 1325); (8) records covered by the official information privilege (Government Code section 6254(k); Evidence Code section1040); and/or (9) records containing confidential business information or trade secrets (Government Code· section 6254(k); California Code of Regulations, title 22, section 66260.2; Evidence Code section 1060; Health and Safety Code sections 25173, 25185(d), 25358.2); (10) records containing geological and geophysical information (Government Code section 6254 (e)). This is not an exhaustive list and other exemptions may prevent disclosure of records.

STATE OF CALIFORNIA—HEALTH AND WELFARE AGENCY
GEORGE DEUKMEJIAN, GOVERNOR

DEPARTMENT OF HEALTH SERVICES
TOXIC SUBSTANCES CONTROL PROGRAM (REGION 3)
1405 N. SAN FERNANDO BOULEVARD, SUITE 300
BURBANK, CA 91504
(818) 567-3000

JUN 22 1990

Mr. Alistaire Callender
Woodward-Clyde Consultants
445 South Figueroa Street
Suite 2600
Los Angeles, California 90071

Dear Mr. Callender:

UNITED CONCRETE PIPE: REVIEW OF PRELIMINARY ENDANGERMENT ASSESSMENT

This Department has reviewed your June 14, 1990 Preliminary Endangerment Assessment report. The Department found that the site was properly characterized and appropriately sampled. Samples were analyzed for flammability (EPA Method 1010), pH (EPA Method 9045), Volatile organics (EPA Method 8240), semi-volatile organics ((EPA Method 8270), and acute aquatic toxicity. The analysis revealed that there were no significant concentrations of hazardous substances. Analytical results indicated that the mineral oil contamination along the pour line is non-hazardous with respect to acute aquatic toxicity. Since mineral oil is not listed as a hazardous substance in Title 22, Article 9, of the State of California Administrative Code, mineral oil contaminated soil along the pour line is not considered a threat to public health or the environment.

Aocording to your information, the forthcoming demolition and development of the property will adequately mitigate hazards associated with the settling pond, cesspool, and underground storage tank. The Department has no objection to construction of the proposed development. However, all wastes should be properly characterized to determine whether they are hazardous, and should be handled according to all state and local disposal regulations. For oversight of the site demolition and excavation contact your local county health officials. The Department, based on data supplied in your report, concurs that the site does not appear to pose a significant threat to public health or the environment.

However, this does not preclude the state from requiring additional investigation for remediation measures for contaminants found to exist at this site and surrounding properties to protect public health or the environment.

Thank you for your continued cooperation in resolving these issues. Please do not hesitate to contact Wendell Francisco at (818) 567-3077, if you require further assistance.

Sincerely,

for Stephen Lavinger, Chief
Site Mitigation Unit

14 June 1990
Project No. 904W217A

Dr. Miguel Monroy
Site Mitigation Unit
California Department of Health Services
1405 San Fernando Boulevard, Suite 300
Burbank, California

SUBJECT: RESPONSE TO REVIEW COMMENTS ON THE PRELIMINARY ENDANGERMENT ASSESSMENT FOR THE UNITED CONCRETE PIPE MANUFACTURING FACILITY IN IRWINDALE CALIFORNIA

Dear Dr. Monroy:

Woodward-Clyde Consultants, on behalf of The Koll Company, is pleased to resubmit for your review two (2) copies of the revised Preliminary Endangerment Assessment (PEA) report for the United Concrete Pipe (UCP) facility in Irwindale, California. This letter presents our response to the Department of Health Services' (DHS) comments on the first draft of the PEA report.

CONCLUSIONS

1. **Insignificant and Petroleum Hydrocarbons (p. 18)**

   Insignificant means the concentrations were generally much lower than 1,000 mg/kg (ppm). Petroleum hydrocarbons are total recoverable petroleum hydrocarbons by EPA Method 418.1 or modified EPA Method 8015.

2. a. **Present Condition of the Facility (pp. 1, 19)**

   UCP has ceased its concrete pipe manufacturing activities. The facility is essentially closed, with structures, equipment, concrete pipes, and pavements to be dismantled and/or removed prior to site development. A small amount of steel fabrication was being conducted on site at the time of a site visit on 12 June 1990.

b. **Proposed Construction (pp. 1, 19)**

The Koll Company plans to develop approximately 55 acres of the property. The City of Irwindale is purchasing the remaining 17 acres for a retail development.

The Koll Company intends to install site improvements, including interior streets, sewers, water, utilities, storm drains, and perimeter and street frontage landscaping. By early 1991, The Koll Company will have divided the property into parcels of varying sizes for construction. The proposed construction would be light industrial and office buildings.

c. **Disposition of Current Structures and Elevated Concentrations of Hazardous and Potentially Hazardous Constituents**

The structures will be demolished and the scrap metal from the manufacturing process may be sold as scrap. Other debris may be used on site as fill or hauled to an offsite disposal facility.

Hazardous and potentially hazardous materials, if uncovered during site demolition or development, will be managed according to applicable city, State, and Federal regulations.

APPENDIX C - SITE INVESTIGATION

This appendix has been changed to Appendix D in the revised report.

1. **Stockpiled Material (p. C-2, paragraph 1)**

The trenches were backfilled with the excavated material. The soil cuttings from the soil borings were left on site next to the borings.

2. **Hydraulic Fluid (p. C-2, paragraph 2; p. 14)**

The MSDS for the hydraulic fluid is in Appendix B. The spill of hydraulic fluid was limited to the surface. The thin layer of soil atop the concrete was sampled. The stained soil, estimated at about 4 cubic yards, was not removed.

3. **Underground Storage Tanks (p. C-5, paragraph 1, p. 4)**

Tank removal records are included in Appendix C.

4. **Swampy Smell (pp. C-4, C-5)**

The swampy smell was an odor similar to a wet, organic-rich smell associated with anaerobic decomposition processes such as those occurring in swamps.

5. **Fluid in Waste Oil Sump (p. C-9, paragraph 2)**

This fluid was removed during the tank removal and disposed of off site. Documentation of this is provided with the tank removal information.

6. **Petroleum Hydrocarbons and Plume in Pour Line (p. C-10, paragraph 1)**

The petroleum hydrocarbons detected in the pour line area were mineral oil, which is not a hazardous waste. The vertical extent of mineral oil-impacted soil has been characterized. The TPH distribution is not uniform from top to bottom based on the data obtained. However, the TPH concentrations decreased with depth and were below 100 mg/kg at a depth of 28 feet.

7. **Cesspools (p. C-10, paragraph 3; Section A.8, p. 9)**

The term "cesspool" refers to septic tank systems. These were necessary because the facility is not on the city sewer system. The cesspools were for the restrooms at the facility. Because of their age, little information is available on the design and construction of the cesspools. However, a UCP employee stated that a leach field may be associated with each cesspool, which is normal for a septic tank system. These cesspools are in the City of Irwindale.

It is unlikely that this effluent would impact the groundwater, which is on the order of 170 feet below grade. Sampling of the onsite well did not reveal groundwater contamination.

8. **Pond Sediment (p. ii, paragraph 2; p. 9)**

Sediment remains in the pond. The pond is not lined with an impervious material. However, water from concrete

processing that drained into the pond over the years may have yielded a relatively impervious barrier at the bottom, because this water contained cement fines from the manufacturing process.

The pond sediment was sampled on 6 June 1990 at five locations at depths up to 3-1/2 feet. The results are summarized in Table 1. At the time of the sampling, the sediment was 2-1/2 feet below the water surface in the deepest part of the pond. The estimated thickness of sediment in the pond ranged from 2 to 3 feet.

Approximate sampling locations are shown on Figure 4, along with locations previously sampled in 1988 and 1989. The total current plan view area of the pond is roughly one-half of that seen when the previous sampling was completed. The dotted line indicates a rough outline of the current water line. The June 1990 sampling locations are shown as S (south), E (east), M (middle), MC (middle central), and MN (middle north).

Samples were collected using a clam shell bucket approximately 1/2 foot in diameter. The device allowed relatively non-disturbed samples of the sediments to be extracted to a depth of approximately 3-1/2 feet. Samples identified with a "6" are from the 6-inch depth. All other sample labels are in reference to depth in feet. At each location, sampling with depth was effected by subsampling the contents of the filled bucket.

Samples were analyzed on site according to modified EPA Method 8015 using a mobile laboratory supplied by Enesco (Garden Grove, California). The mobile laboratory is certified as a hazardous waste laboratory by the DHS. Results of the testing are summarized in Table 1, and copies of the laboratory reports and the chain-of-custody forms are attached to this letter.

The pond sediment will be excavated as part of the site development process, and the excavated material will be managed in compliance with applicable regulatory requirements. Management options include onsite bioremediation, or offsite disposal at an approved facility.

9. **TPH Concentrations**

Surface spills have occurred at several locations during past operations at the UCP facility. As a result, elevated concentrations of TPH were detected in the surface and near-surface soil. One exception is the pour line area, where mineral oil has migrated to a depth of 28 feet below grade. This substance, however, is not hazardous according to the MSDS and soil analysis data.

The petroleum hydrocarbons used in the manufacturing of concrete pipes, mineral oil and paraffin wax, are non-hazardous materials. In view of this and the proposed removal of pavements and surface soil in the site development plan, we judge that it is unlikely that the TPH would pose a threat to public health and the environment.

10. During demolition of the site, material identified as hazardous will be managed in accordance with applicable regulations. An example of such materials are the two small buckets of what appeared to be waste hydraulic oil found on the site during the 12 June 1990 site visit by DHS personnel.

We appreciate the assistance and cooperation of the DHS in the review of the draft PEA report. Please call me at 714/835-6886 if you have questions or comments.

Very truly yours,

WOODWARD-CLYDE CONSULTANTS

This Material Safety Data Sheet contains environmental, health and toxicology information for your employees. Please make sure this information is given to them. It also contains information to help you meet community right-to-know/emergency response reporting requirements under SARA Title III and many other laws. If you resell this product, this MSDS must be given to the buyer or the information incorporated in your MSDS. Discard any previous edition of this MSDS.

The Chevron MSDS has been revised to include a first aid statement for the accidental injection under the skin.

1. PRODUCT IDENTIFICATION

CHEVRON AW Hydraulic Oil 68

- A HAZARD WARNING IS NOT REQUIRED FOR THIS PRODUCT UNDER OSHA HAZARD COMMUNICATION STANDARD (29 CFR 1910.1200)

CHEVRON PRODUCT NUMBER(S): CPS234228
PRODUCT INFORMATION: (800)582-3836

Revision Number: 11 Revision Date: 11/18/89 MSDS Number: 000080
NDA - No Data Available NA - Not Applicable

Prepared According to the OSHA Hazard Communication Standard (29 CFR 1910.1200) by the Chevron Environmental Health Center, Inc., P.O. Box 4054, Richmond, CA 94804.

2. FIRST AID

EYE CONTACT:
No first aid procedures are required. However, as a precaution flush eyes with fresh water for 15 minutes. Remove contact lenses if worn.
SKIN CONTACT:
No first aid procedures are required. As a precaution, wash skin thoroughly with soap and water. Remove and wash contaminated clothing.

Note to Physician: Injection under the skin of materials similar to this product is associated with accidents involving high-pressure equipment. When ejected from this type of equipment, the material can easily penetrate the skin and leave a small, sometimes bloodless, puncture wound. Yet, because of its driving force, material injected into a fingertip can be deposited into the palm of the hand. Within 24 hours, there is usually a great deal of swelling, discoloration, and intense throbbing pain in the affected part. Immediate treatment at surgical emergency center is recommended.
INHALATION:
Since this material is not expected to be an immediate inhalation problem, no first aid procedures are required.
INGESTION:
If swallowed, give water or milk to drink and telephone for medical advice. Consult medical personnel before inducing vomiting. If medical advice cannot be obtained, then take the person and product container to the nearest medical emergency treatment center or hospital.

3. IMMEDIATE HEALTH EFFECTS

EYE CONTACT:
This substance is not expected to cause prolonged or significant eye irritation. This hazard evaluation is based on the data from similar materials.
SKIN IRRITATION:
This substance is not expected to cause prolonged or significant skin irritation. This hazard evaluation is based on data from similar materials.
DERMAL TOXICITY:
The systemic toxicity of this substance has not been determined. However, it should be practically non-toxic to internal organs if it gets on the skin. This hazard evaluation is based on data from similar materials.
RESPIRATORY/INHALATION:
The systemic toxicity of this substance has not been determined. However, it should be practically non-toxic to internal organs if inhaled. This hazard evaluation is based on data from similar materials.
INGESTION:
The systemic toxicity of this substance has not been determined. However, it should be practically non-toxic to internal organs if swallowed. This hazard evaluation is based on data from similar materials.

4. PROTECTIVE EQUIPMENT

EYE PROTECTION:
No special eye protection is usually necessary.
SKIN PROTECTION:
No special skin protection is usually necessary. Avoid prolonged or frequently repeated skin contact with this material. Skin contact can be minimized by wearing protective clothing.
RESPIRATORY PROTECTION:
No special respiratory protection is normally required. However, if operating conditions create airborne concentrations which exceed the recommended exposure standards, the use of an approved respirator is required.
VENTILATION:
Use adequate ventilation to keep the airborne concentrations of this material below the recommended exposure standard.

5. FIRE PROTECTION

FLASH POINT: (COC) 428F (220C)
AUTOIGNITION: NDA
FLAMMABILITY: NA
EXTINGUISHING MEDIA:
CO2, Dry Chemical, Foam and Water Fog.
NFPA RATINGS: Health 0; Flammability 1; Reactivity 0; Special NDA;
HMIS RATINGS: Health 0; Flammability 1; Reactivity 0; Other NDA;
(Least-0, Slight-1, Moderate-2, High-3, Extreme-4). These values are obtained using the guidelines or published evaluations prepared by the National Fire Protection Association or, if applicable, the National Paint and Coating Association, and do not necessarily reflect the hazard evaluation of the Chevron Environmental Health Center. Read the entire document and label before using this product.
FIRE FIGHTING PROCEDURES:
For fires involving this material, do not enter any enclosed or confined fire space without proper protective equipment, including self-contained breathing apparatus.
COMBUSTION PRODUCTS:
Normal combustion forms carbon dioxide and water vapor and may produce oxides of sulfur and phosphorus. Incomplete combustion can produce carbon monoxide.

6. STORAGE, HANDLING, AND REACTIVITY

HAZARDOUS DECOMPOSITION PRODUCTS:
NDA.
STABILITY:
Stable.

HAZARDOUS POLYMERIZATION:
Polymerization will not occur.
INCOMPATIBILITY:
May react with strong oxidizing agents, such as chlorates, nitrates, peroxides, etc.
SPECIAL PRECAUTIONS:
CAUTION! Do not use pressure to empty drum or explosion may result. DO NOT weld, heat or drill container. Replace cap or bung. Emptied container still contains hazardous material which may ignite with explosive violence if heated sufficiently.

7. PHYSICAL PROPERTIES

SOLUBILITY: Soluble in hydrocarbon solvents; insoluble in water.
APPEARANCE: Pale yellow liquid.
BOILING POINT: NA
MELTING POINT: NA
EVAPORATION: NA
SPECIFIC GRAVITY: 0.88 @ 15.5/15.6C
VAPOR PRESSURE: NA
PERCENT VOLATILE (VOLUME %): NA
VAPOR DENSITY (AIR=1): NA
VISCOSITY: 61 cSt @ 40C (Min.)

8. SPILL RESPONSE AND DISPOSAL

CHEMTREC EMERGENCY PHONE NUMBER: (800) 424-9300 (24 hour).
SPILL/LEAK PRECAUTIONS:
This material is not expected to present any environmental problems other than those associated with oil spills.

Stop the source of the leak or release. Clean up releases as soon as possible. Contain liquid to prevent further contamination of soil, surface water or groundwater. Clean up small spills using appropriate techniques such as sorbent materials or pumping. Where feasible and appropriate, remove contaminated soil. Follow prescribed procedures for reporting and responding to larger releases.
DISPOSAL METHODS:
Place contaminated materials in disposable containers and dispose of in a manner consistent with applicable regulations. Contact local environmental or health authorities for approved disposal of this material.

9. EXPOSURE STANDARDS, REGULATORY LIMITS AND COMPOSITION

COMPOSITION COMMENT:

12. ADDITIONAL HEALTH DATA

ADDITIONAL HEALTH DATA COMMENT:
This product contains petroleum base oils which may be refined by various processes including severe solvent extraction, severe hydrocracking, or severe hydrotreating. None of the oils require a cancer warning under the OSHA Hazard Communication Standard (29 CFR 1910.1200). These oils have not been listed in the National Toxicology Program (NTP) Annual Report nor have they been classified by the International Agency for Research on Cancer (IARC) as; carcinogenic to humans (Group 1), probably carcinogenic to humans (Group 2A), or possibly carcinogenic to humans (Group 2B).

Woodward-Clyde Consultants

14 June 1990
Project No. 904W217A

Dr. Miguel Monroy
Site Mitigation Unit
California Department of Health Services
1405 San Fernando Boulevard, Suite 300
Burbank, California

SUBJECT: RESPONSE TO REVIEW COMMENTS ON THE PRELIMINARY ENDANGERMENT ASSESSMENT FOR THE UNITED CONCRETE PIPE MANUFACTURING FACILITY IN IRWINDALE CALIFORNIA

Dear Dr. Monroy:

Woodward-Clyde Consultants, on behalf of The Koll Company, is pleased to resubmit for your review two (2) copies of the revised Preliminary Endangerment Assessment (PEA) report for the United Concrete Pipe (UCP) facility in Irwindale, California. This letter presents our response to the Department of Health Services' (DHS) comments on the first draft of the PEA report.

CONCLUSIONS

1. **Insignificant and Petroleum Hydrocarbons (p. 18)**

   Insignificant means the concentrations were generally much lower than 1,000 mg/kg (ppm). Petroleum hydrocarbons are total recoverable petroleum hydrocarbons by EPA Method 418.1 or modified EPA Method 8015.

2. a. **Present Condition of the Facility (pp. 1, 19)**

   UCP has ceased its concrete pipe manufacturing activities. The facility is essentially closed, with structures, equipment, concrete pipes, and pavements to be dismantled and/or removed prior to site development. A small amount of steel fabrication was being conducted on site at the time of a site visit on 12 June 1990.

b. **Proposed Construction (pp. 1, 19)**

The Koll Company plans to develop approximately 55 acres of the property. The City of Irwindale is purchasing the remaining 17 acres for a retail development.

The Koll Company intends to install site improvements, including interior streets, sewers, water, utilities, storm drains, and perimeter and street frontage landscaping. By early 1991, The Koll Company will have divided the property into parcels of varying sizes for construction. The proposed construction would be light industrial and office buildings.

c. **Disposition of Current Structures and Elevated Concentrations of Hazardous and Potentially Hazardous Constituents**

The structures will be demolished and the scrap metal from the manufacturing process may be sold as scrap. Other debris may be used on site as fill or hauled to an offsite disposal facility.

Hazardous and potentially hazardous materials, if uncovered during site demolition or development, will be managed according to applicable city, State, and Federal regulations.

APPENDIX C - SITE INVESTIGATION

This appendix has been changed to Appendix D in the revised report.

1. **Stockpiled Material (p. C-2, paragraph 1)**

The trenches were backfilled with the excavated material. The soil cuttings from the soil borings were left on site next to the borings.

2. **Hydraulic Fluid (p. C-2, paragraph 2; p. 14)**

The MSDS for the hydraulic fluid is in Appendix B. The spill of hydraulic fluid was limited to the surface. The thin layer of soil atop the concrete was sampled. The stained soil, estimated at about 4 cubic yards, was not removed.

3. **Underground Storage Tanks (p. C-5, paragraph 1, p. 4)**

Tank removal records are included in Appendix C.

4. **Swampy Smell (pp. C-4, C-5)**

The swampy smell was an odor similar to a wet, organic-rich smell associated with anaerobic decomposition processes such as those occurring in swamps.

5. **Fluid in Waste Oil Sump (p. C-9, paragraph 2)**

This fluid was removed during the tank removal and disposed of off site. Documentation of this is provided with the tank removal information.

6. **Petroleum Hydrocarbons and Plume in Pour Line (p. C-10, paragraph 1)**

The petroleum hydrocarbons detected in the pour line area were mineral oil, which is not a hazardous waste. The vertical extent of mineral oil-impacted soil has been characterized. The TPH distribution is not uniform from top to bottom based on the data obtained. However, the TPH concentrations decreased with depth and were below 100 mg/kg at a depth of 28 feet.

7. **Cesspools (p. C-10, paragraph 3; Section A.8, p. 9)**

The term "cesspool" refers to septic tank systems. These were necessary because the facility is not on the city sewer system. The cesspools were for the restrooms at the facility. Because of their age, little information is available on the design and construction of the cesspools. However, a UCP employee stated that a leach field may be associated with each cesspool, which is normal for a septic tank system. These cesspools are in the City of Irwindale.

It is unlikely that this effluent would impact the groundwater, which is on the order of 170 feet below grade. Sampling of the onsite well did not reveal groundwater contamination.

8. **Pond Sediment (p. 11, paragraph 2; p. 9)**

Sediment remains in the pond. The pond is not lined with an impervious material. However, water from concrete

processing that drained into the pond over the years may have yielded a relatively impervious barrier at the bottom, because this water contained cement fines from the manufacturing process.

The pond sediment was sampled on 6 June 1990 at five locations at depths up to 3-1/2 feet. The results are summarized in Table 1. At the time of the sampling, the sediment was 2-1/2 feet below the water surface in the deepest part of the pond. The estimated thickness of sediment in the pond ranged from 2 to 3 feet.

Approximate sampling locations are shown on Figure 4, along with locations previously sampled in 1988 and 1989. The total current plan view area of the pond is roughly one-half of that seen when the previous sampling was completed. The dotted line indicates a rough outline of the current water line. The June 1990 sampling locations are shown as S (south), E (east), M (middle), MC (middle central), and MN (middle north).

Samples were collected using a clam shell bucket approximately 1/2 foot in diameter. The device allowed relatively non-disturbed samples of the sediments to be extracted to a depth of approximately 3-1/2 feet. Samples identified with a "6" are from the 6-inch depth. All other sample labels are in reference to depth in feet. At each location, sampling with depth was effected by subsampling the contents of the filled bucket.

Samples were analyzed on site according to modified EPA Method 8015 using a mobile laboratory supplied by Enesco (Garden Grove, California). The mobile laboratory is certified as a hazardous waste laboratory by the DHS. Results of the testing are summarized in Table 1, and copies of the laboratory reports and the chain-of-custudy forms are attached to this letter.

The pond sediment will be excavated as part of the site development process, and the excavated material will be managed in compliance with applicable regulatory requirements. Management options include onsite bioremediation, or offsite disposal at an approved facility.

9. **TPH Concentrations**

Surface spills have occurred at several locations during past operations at the UCP facility. As a result, elevated concentrations of TPH were detected in the surface and near-surface soil. One exception is the pour line area, where mineral oil has migrated to a depth of 28 feet below grade. This substance, however, is not hazardous according to the MSDS and soil analysis data.

The petroleum hydrocarbons used in the manufacturing of concrete pipes, mineral oil and paraffin wax, are non-hazardous materials. In view of this and the proposed removal of pavements and surface soil in the site development plan, we judge that it is unlikely that the TPH would pose a threat to public health and the environment.

10. During demolition of the site, material identified as hazardous will be managed in accordance with applicable regulations. An example of such materials are the two small buckets of what appeared to be waste hydraulic oil found on the site during the 12 June 1990 site visit by DHS personnel.

We appreciate the assistance and cooperation of the DHS in the review of the draft PEA report. Please call me at 714/835-6886 if you have questions or comments.

Very truly yours,

WOODWARD-CLYDE CONSULTANTS

Alistaire Callender, Ph.D.
Project Manager

Los Angeles, California 90071

Dear Mr. Callender:

REVIEW OF PRELIMINARY ENDANGERMENT ASSESSMENT FOR THE UNITED CONCRETE PIPE MANUFACTURING FACILITY IN BALDWIN PARK, CALIFORNIA

We have completed our review of the Preliminary Endangerment Assessment (PEA) report for your property at 14041 East Live Oak Avenue, Baldwin Park, California. The report was reviewed by the Project Manager and Staff Toxicologist for completeness and accuracy.

The attached comments identify the information necessary to complete the assessment. Items marked with an asterisk (*) are cited as suggestions for clarity. For ease of reference, comments are proceeded by the section/page number of the PEA as prepared by Woodward-Clyde Consultants.

Please submit two copies of the revised PEA with the corrections by June 25, 1990. If you have any questions during the revision process, please contact Wendell Francisco at (818) 576-3077.

Sincerely,

for Miguel Monroy
Program Supervisor
Site Mitigation Unit

Enclosure

ENCLOSURE

The subject report prepared by Woodward-Clyde Consultants was reviewed by the Department of Health Services, Toxic Substance Control Program (Department). The Department has the following comments:

Comments:

SECTION 9: CONCLUSIONS

* - page 18, second statement: The concentration levels of petroleum hydrocarbons are considered to be insignificant in the soil except at the pour line. Please specify what is meant by "insignificant" and "petroleum hydrocarbons" in this sentence.

* - page 19, second statement: Please explain what is meant by the "facility, in its present condition does not pose a threat to public health and the environment." What is the present condition of the facility? Please explain the proposed construction of light industrial and office buildings on property. What will happen to the current structures and elevated concentrations of hazardous or potential hazardous constituents currently existing on the site.

APPENDIX C: SITE INVESTIGATION

* - page C-2: paragraph 1: After samples were collected, no reference was made relative to disposal of the stockpiled material. Was this material disposed of at an appropriate landfill or is it yet on the site? Please clarify this point of interest.

- page C-2, paragraph 2: Please provide more information on the hydraulic fluid/or form oil found 10-20 feet above a concrete structure in Area D. What constituents make up the hydraulic fluid? Was this portion of contaminated soil removed?

- page C-5, paragraph 1: Please provide documented information relative to all the underground storage tank removals and verification sampling (or sign off).

- page C-5, paragraph 1: Please explain what the swampy smell may have been or was.

- page C-9, paragraph 2: What happened to the fluid contained in the underground tank in Area B which showed elevated hydrocarbons concentrations (1,000,000 ppm total petroleum hydrocarbons, EPA Method 418.1; 7 ppm total lead; and 83,600 ppm diesel hydrocarbons, by EPA Method 8015). Also please provide documentation of this tank removal and sign off.

* - page C-10, paragraph 1: Soil samples taken below approximately 20

feet show low levels of petroleum hydrocarbons. Can you specify what petroleum hydrocarbons are being referred to - benzene, mineral oil or etc? Has this plume been fully characterized to assure uniformity of the petroleum hydrocarbons from top to bottom?

- page C-10, paragraph 3: CES-1B contained 112 ppb of volatile hydrocarbons ((BTXE). Please explain the construction of the cesspools? Does the contaminated effluent settle down to the groundwater? Is there an impervious layer that prevents contaminants from settling into the groundwater? Is the groundwater potable? What city are the cesspools in?

- page C-11, paragraph 2: This paragraph states sediment samples from the pond on the western side of the property showed elevated, concentrations of total petroleum hydrocarbons (4,430 ppm), with kerosene (2,540 ppm) the dominant fraction. What happened to this sediment? Is the pond lined with an impervious material? How far down was the elevated petroleum hydrocarbons detected? Was this pond area excavated and sampled to verify no remaining elevated hydrocarbons present?

- The Department is concerned with the elevated concentrations of TPH found throughout the site. Explain if the TPH's may present any health or environmental effects.

Re: Preliminary Endangerment Assessment for
Property at 14041 East Live Oak Avenue
Baldwin Park, CA

Dear Mr. Francisco:

This law firm represents The Koll Company in connection with its efforts to purchase and develop the above-captioned property. Enclosed please find a preliminary endangerment assessment (PEA) report to the Department of Health Services (DHS) prepared by Woodward-Clyde Consultants on behalf of The Koll Company. This PEA has been prepared in accordance with DHS's December 1989 draft guidelines and is for the property located at 14041 East Live Oak Avenue, Irwindale, California.

LAW OFFICES
ALLEN, MATKINS, LECK, GAMBLE & MALLORY
A PARTNERSHIP INCLUDING PROFESSIONAL CORPORATIONS

Pursuant to applicable law and your letter of April 19, 1990 to The Koll Company, a check for $7,500 will be submitted to the State Board of Equalization under separate cover upon receipt of their billing. As we discussed with Mr. Hamid Safir of your department, The Koll Company would appreciate your rapid review of this document since the property in question is in escrow to be purchased by The Koll Company and the City of Irwindale. Therefore, we request that you provide us with written notification on or before May 29, 1990 of DHS's determination of whether or not further investigation or action is required for the site.

Very truly yours,

Bruce Howard

Re: Preliminary Endangerment Assessment
United Concrete Pipe Site - Irwindale

Dear Wendell:

At this time I would like to request the Department of Health Services' oversight and review of Woodward-Clyde's PEA Report regarding the United Concrete Pipe site in Irwindale. As requested, I have provided the following information:

o Site Name:	United Concrete Pipe Site
o Address:	14041 East Live Oak Avenue Irwindale, California
o Legal Owner:	United Concrete Pipe Corporation
o Environmental Consultant:	Woodward-Clyde Consultants
o Nature of Report:	Evaluation of Site Conditions
o Billing Name:	The Koll Company 818 West Seventh Street Suite 700 Los Angeles, CA 90017 Attn: Peter Tilton

Should you require any additional information, please do not hesitate to call.

Sincerely,

Peter C. Tilton
Development Manager

PRELIMINARY ENDANGERMENT ASSESSMENT FOR THE UNITED CONCRETE PIPE MANUFACTURING FACILITY AT 14041 EAST LIVE OAK AVENUE IRWINDALE, CALIFORNIA

1.0 INTRODUCTION

This report presents the results of a preliminary endangerment assessment (PEA) for the United Concrete Pipe (UCP) manufacturing facility in Irwindale, California. The PEA has been prepared using the draft guidance document of the Toxic Substances Control Program, California Department of Health Services (DHS) (State of California, 1989).

The objective of the PEA was to evaluate whether current or past operations at the site have resulted in the release of hazardous substances, posing a threat to public health and the environment. Upon review of the PEA report, DHS would recommend either "no further action" or site characterization and remediation.

Woodward-Clyde Consultants (Woodward-Clyde) has conducted site assessments, including sampling and analysis of soil and water, at areas of concern at the site (Woodward-Clyde Consultants, 1988 and 1989). The data obtained in these assessments were used in the preparation of this PEA for the UCP facility.

The facility is in the closure process. The Koll Company plans to develop approximately 55 acres of the property as a commercial park, with office and light industrial buildings. The City of Irwindale is purchasing 17 acres for a retail development.

2.0 SITE HISTORY AND DESCRIPTION

2.1 Site Location

The 74-acre UCP facility is located at 14041 East Live Oak Avenue in Irwindale, California (Figure 1). The telephone number is: 818/337-1211. The legal description of the UCP facility is recorded in Book 6, pages 80 through 82, and Parcels 639 and 642 (see Figure 2), within Township 1 South, Range 10 West, Section 6, in the subdivision of the Rancho Azusa De Duarte, in the City of Irwindale, Los Angeles County.

The facility has an EPA identification number for generation of waste oil; it is not listed on the Abandoned Site Program Information System (ASPIS) database.

2.2 Past and Current Site Activities

UCP has occupied this facility since it was constructed in 1936, and has manufactured a variety of types of concrete pipe at the facility since its inception. Figure 3 is a facility map showing site features.

The property is owned by UCP and was formerly operated as a concrete pipe manufacturing facility. No other businesses have been conducted on the premises by UCP or other corporations.

Two process activities at the facility produce effluent streams. In the centrifugal plant, paraffin (wax) is used in the concrete pipe form molds. Once the concrete pipe is set up, the paraffin is removed by steam. The bulk of the paraffin is contained immediately, but some residual amount remains within the steam cleaning effluent, which flows into one of two clarifiers. The clarifiers are composed of sections of concrete pipe buried vertically in the ground and connected near the bottom by horizontal pipe. The system

allows the paraffin to float to the surface of the first pipe(s) and be skimmed off manually. The clarified effluent then flows out the top of the last pipe section and travels via a gutter to an underground drain, which empties into the onsite settling pond located on the west side of the facility.

The water that drains to the settling pond is recycled for use in curing the manufactured concrete pipe, which is the second process with an effluent stream. Rainbird sprinklers keep the surface of the concrete pipe moist during the curing period. Runoff water from this process either evaporates or flows into a surface drain or channel and is directed back to the settling ponds for recycling. Appendix A contains flow diagrams of the manufacturing processes that were used at the facility.

On the average, UCP has manufactured approximately 84,000 tons of concrete pipes annually in the last 3 years. In the manufacturing of concrete pipes, various raw materials and chemicals were used. These included aggregate(s) (gravel and rock), sand, cement (Types 2 and 5), steel (rods, bands, and mains), and small quantities of form oil (predominantly mineral oil), Amercoat (coal tar epoxy), concrete plasticizer (WRDA-19), and admixture for concrete. Material safety data sheets (MSDS) are provided in Appendix B for those chemicals which have MSDSs.

2.3 Hazardous Waste Management

According to information supplied by UCP in response to an inquiry by the Environmental Protection Agency concerning the San Gabriel Valley groundwater investigation, the facility does not generate, store, treat, or dispose of hazardous

waste and has never used chlorinated solvents on site. A review of files available at regulatory agencies' offices supported this claim. These agencies included the following:

- U.S. Environmental Protection Agency (EPA), Region IX
- Los Angeles County Department of Public Works (LACDPW)
- California Department of Health Services
- California Regional Water Quality Control Board (RWQCB) - Los Angeles Region
- Los Angeles County Department of Health Services
- Los Angeles County Fire Department
- South Coast Air Quality Management District (SCAQMD).

There are no hazardous waste permits currently or previously held by the facility. However, UCP has an NPDES permit from the California Regional Water Quality Control Board (RWQCB) for the discharge of process water, and several permits from the South Coast Air Quality Management District (SCAQMD) for dust control. A listing of permits is provided in Table 1. The EPA identification number was for the generation of waste oil.

There have been no inspections or citations given by regulatory agencies concerning waste management at the site. Woodward-Clyde personnel visited the UCP facility on 9 December 1988 during the initial preliminary site assessment. The observations made during this site visit are summarized in Table 2.

TABLE 2

AREAS OF POTENTIAL ENVIRONMENTAL CONCERN IDENTIFIED IN THE DECEMBER 1988 SITE VISIT

Area(1)	Environmental Concern
A	Underground fuel storage tanks: (1) One 10,000-gallon unleaded, steel, single-wall, with two vadose-zone monitoring wells (2) One 10,000-gallon diesel, fiberglass, double-wall, with annular liquid sensor. Both tanks were installed under the direction of LACDPW, and permits have been applied for. Also, two 10,000-gallon and one 1,000-gallon fuel tanks have been removed from this area. LACDPW has signed off the excavation as clean.
B	Waste oil sump with known soil contamination.
C	Significant surface staining in form oil area.
D	Large stained area under rail equipment, next to vertical casting area.
E	55-gallon drum set up for dispensing; unknown content; surface staining around drum and soil.
F	Rail crane maintenance; surface staining.
G	Engine steam-cleaning area with asphalt dike and soil bottom. Several 55-gallon drums next to it labeled as hydraulic oil and thinner. Possible solvent use in this area.
H	Several drums labeled as WRDA-19 superplasticizer, ASTM C-494.
I	Pallet of 1- to 5-gallon containers of paints and solvents sitting in the open.
J	Electrical transformers containing PCBs; labeled, diked, and fenced.
K	55-gallon drums labeled McGean-Rohco, Inc., form finish oil (Product # 15607).
L	55-gallon drum set up for dispensing thinner. No surface staining on gravel soil.
M	Water draining out the back wall of the ring plant, possibly from metal cutting processes.
N	One 8,000-gallon and two 10,000-gallon diesel tanks excavated and removed from this area. LACDPW has signed off the excavations as clean.
O	Settling pond.
P	Paraffin collecting areas.
Q	Hydraulic fluid all around stripper tracks.
R	20-gallon drum of weed killer on pallet, in open.
S	Electrical transformer in basement crawlspace; unlabeled and possibly PCB-containing.

(1) See Figure 3, Facility Map.

2.4 Management of Underground Storage Tanks

There were seven underground storage tanks (USTs) at the UCP facility which had been removed as of March 1989. These USTs, ranging in capacity from 1,000 gallons to 10,000 gallons, were used to store gasoline, diesel fuel, and waste oil. The removal of these USTs and affected soil was performed with closure permits from the Los Angles County Department of Public Works (LACDPW) during the period of October 1987 to March 1989.

Currently, there are two 10,000-gallon, active USTs: one stores unleaded gasoline, and the other stores diesel. These two tanks are operating with a permit (No. HMUSP157) from the LACDPW. According to the proposed site development plan, the tanks will be removed prior to site grading. Tank removal records are included in Appendix C.

3.0 APPARENT PROBLEM

Woodward-Clyde conducted a field investigation during the period of December 1988 to January 1989 to evaluate potential areas of concern identified in the preliminary site assessment. Trenches were excavated and samples collected from the surface and at varying depths from Areas B, C, D, E, F, M, P, and Q (see Figure 4). In addition, samples of water and sludge were collected from the ponds (Area O), and samples of solids were collected from onsite waste piles. Details of the field investigation and findings are summarized in Section 4, Sampling Activities.

4.0 SAMPLING ACTIVITIES

Woodward-Clyde conducted a field investigation to assess the potential presence and concentrations of petroleum

hydrocarbons and chemicals of concern at eight areas. Water and sludge samples from the settling ponds and solid samples from onsite waste piles were also collected for laboratory analysis. Details of the field investigation program are provided in Appendix D. Figure 4 shows sampling locations. Analytical results are included in Appendix E and are summarized in Tables 3 and 4.

4.1 Pour Line - Area C

Soil samples were collected from trenches and borings along the pour line (Area C) at the locations shown on Figure 4. The analytical data presented in Table 3 show that total petroleum hydrocarbons (TPH) at concentrations exceeding 100 ppm were present at depths of up to approximately 24 feet at locations along the pour line. At depths greater than 24 feet, TPH concentrations declined to levels below 100 ppm.

4.2 Centrifugal Line - Areas N, O, Q

This area is the oldest part of the facility, and visible soil staining was present. Trenches were excavated and borings advanced in the area outside of the building, because equipment access to the interior of the building was limited. The area was generally covered with layers of asphalt and/or concrete of varying thicknesses.

Generally, in the areas where it was present, the visible staining appeared to be confined to the top 8 to 10 inches of soil. The material in and on the soil appeared to be hydrocarbons (such as wax or form oil) associated with the manufacturing operation. No evidence of volatile organic compounds was uncovered during field work. Screening of soil for volatiles was performed with an organic vapor analyzer (OVA), using a headspace analysis technique.

(1) Samples collected from north and south ends of pond; see Figure 4.
(2) ND = not detected; specific detection limits presented in Appendix E.

4.3 Batch Plant - Area H

WRDA-19, a concrete plasticizer and water-reducing compound was stored at the batch plant (Area H). Volatile organic compounds were not detected using headspace analysis by an OVA. Soil under the asphalt paving was stained, but no staining was noted at the 8- or 16-inch depths.

4.4 Thinner Storage Area/Ring Plant - Area L

A surface soil sample collected from the thinner storage area (Area L) and analyzed for volatile organic compounds by EPA Method 8240 contained 2,100 ppm of C_9-C_{11} hydrocarbons. A soil sample collected at a 5-foot depth did not contain measurable amounts of hydrocarbons or volatile organic compounds.

Soil samples were taken at the ring plant (Area M) and evaluated using EPA Method 8240. These samples showed no detectable concentrations of volatile organic compounds. Soil samples were also collected from an area where water drains out the back wall of the ring plant. UCP personnel reported that this water is non-contact cooling water used in the ring plant. The analytical results showed no detectable concentrations of volatile organic compounds in this area, except for 3 ppm of a C_8-C_{11} hydrocarbon fraction in a surface sample.

4.5 Solvent Usage Areas - Areas I and G

According to UCP personnel, there has been no significant solvent use at the facility. The area of suspected solvent storage/use identified, Area I, was investigated by installing trenches (I1 and I2). No visible evidence of solvents, such as a loss of integrity, was present on the

asphalt overlying this area, and excavation of the two trenches did not uncover evidence of volatile organic chemicals when the soil was screened with an OVA.

One other area of suspected solvent use was west of the garage area, where steam-cleaning of vehicles occurred. Again, trenches were excavated (G1 and G2), but no evidence of the presence of solvents, such as odor or elevated OVA readings, was observed in soil samples taken from the trenches. It should be noted that this area was covered by a concrete slab and asphalt.

4.6 Transformer Area - Area Q

According to information furnished by UCP, the polychlorinated biphenyls (PCBs) transformer dikes were installed in 1981. Concrete slabs existed at that time and presumably were poured prior to initial transformer installation. Probable dates of transformer installation are: poured pipe cage, Mach transformer, 1963; I.C.E. Building transformers, 1963; vertical cylinder plant transformers, 1968.

A soil sample from the transformer area (Area Q) was analyzed for PCBs; the concentration was not detectable at 1 µg/kg (ppb). Soil samples from the surface and from an approximately 5-foot depth were also collected and analyzed from Area J3, where a transformer is located. PCBs were not detected in the soil samples, and there was no visible discoloration of the soil. Trenches were also excavated adjacent to the transformers at the steel storage building (J2) and the cage machine building (J1). Again, no visible evidence of soil contamination was present.

4.7 Ponds

There are a number of settling ponds at the site. The major pond is located on the western portion of the facility, and received both runoff from the site and the effluent from the pipe curing operations (see Section 2.2). This water was recycled during normal plant operations. Other settling ponds are located east of the centrifugal line (P3 on Figure 4) and west of the centrifugal line (01 and 02 on Figure 4).

Samples of water and sediment were collected from these ponds. Analytical results of the sediment samples are summarized in Table 3; Table 4 presents the aqueous analytical results. The aqueous samples from the pond on the west side of the facility did not contain detectable amounts of volatile organic compounds (EPA Method 8240). The ponds adjacent to the centrifugal line also did not contain detectable amounts of volatile organic compounds, except for 2 ppb of toluene and 57 ppb of methylene chloride in one sample. However, sediment samples collected from the southern end of the pond on the west side of the facility contained elevated (greater than 1,000 ppm) concentrations of TPH (see Table 3, sample number PBSED2). More comprehensive sampling conducted in June 1990 included the collection of ten additional sediment samples, at depths of 6, 24, 36, and/or 42 inches at five locations. Concentrations of TPH for these samples were less than 500 ppm as measured by EPA Method 418.1. Moreover, the TPH concentration decreased with depth at four of the five sampling locations, and all of the samples collected below the 24-inch depth showed TPH concentrations less than 200 ppm.

4.8 Septic Tanks

Aqueous samples were collected from the septic tanks (cesspools) and analyzed for solvents and metals. The results indicated that the septic tanks probably received primarily domestic flows and not solvents or waste streams from the manufacturing process (see Table 4). One possible exception is the septic tank at the northwest corner of the main shop building, which contained low concentrations of benzene (2 ppb), toluene (30 ppb), and xylenes (80 ppb). Due to the age of the cesspools, little information is available on their design and construction. However, according to UCP personnel, it is likely that a leach field is associated with each cesspool. The tested cesspools are located within the manufacturing facility north of Live Oak Avenue and are in the City of Irwindale.

Underlying stratigraphy has been reported to consist primarily of sands and cobbles to depths explored. Under normal conditions, this would probably allow for the biological activity necessary for the leach field treatment concept to be viable. Groundwater is reported to occur at a depth of approximately 170 feet below the site. Therefore, it is unlikely that the groundwater quality is impacted by the effluent leaving the cesspools.

4.9 Waste Oil Sump - Area B

The waste oil sump area (Area B) consisted of a 500-gallon concrete sump piped to a 3,000-gallon steel storage tank. Part of this area was excavated and two samples were collected, at about 1 foot up from the bottom of the tank at both ends. The samples in the south and north ends at a depth of 10 feet showed 607 and 38 ppm of total petroleum hydrocarbons, respectively.

The waste oil sump area was excavated in March 1989, and the sump and tank, along with about 150 tons of affected soil, were removed and disposed of off site.

4.10 Evaluation of Hazardous Characteristics

Two soil samples from the pour line area (Area C) were evaluated to assess whether they were hazardous under the California Administrative Code, Title 22. These samples were collected from depths of 16 and 23 feet, respectively. These depths were chosen so that the characteristics of the petroleum hydrocarbons used as form oil in the past could be evaluated. The samples were analyzed for flammability (EPA Method 1010), pH (EPA Method 9045), volatile organics (EPA Method 8240) and semi-volatile organics (EPA Method 8270), and acute aquatic toxicity. Results are included in Appendix E. The material was found to have no detectable flash point. The material was not corrosive because pH of the material was between 8.74 and 9.13. Volatile organics quantified in the samples were toluene (0.05 ppm), ethylbenzene (0.03 ppm), and 1,1,1-tri- chloroethane (0.03 ppm). Acetone at 0.60 ppm was detected in one sample; the State-certified laboratory (CRL) stated that this was most likely attributable to laboratory contamination. No semi-volatile organic compounds were detected in the two soil samples analyzed. Furthermore, results indicated that the material is non-hazardous with respect to acute aquatic toxicity.

4.11 Summary of Site Investigation

The investigative program conducted by Woodward-Clyde evaluated the areas of potential environmental concern at the UCP manufacturing facility. Soil, sediment, or water samples from the pour line, waste oil sump, centrifugal line, and ponds contained elevated concentrations of organic compounds,

primarily petroleum hydrocarbons. A surface sample collected from the thinner storage area also contained elevated concentrations of petroleum hydrocarbons.

Soil at the pour line contained elevated concentrations (greater than 100 ppm) of C_8-C_{35} hydrocarbons at depths of up to 24 feet below the ground surface, along a length of approximately 400 feet and width of about 25 feet. Samples with elevated concentrations of hydrocarbons from the pour line area were non-hazardous waste per Title 22 of the California Administrative Code criteria.

In general, although the soil from specific areas of the site, most notably the pour line, contains elevated concentrations of hydrocarbons, it appears that the release of hydrocarbons in soil is limited to past site activities. No evidence of significant releases of solvents was uncovered by this investigation, although low concentrations of volatile organic hydrocarbons were found in the soil at some locations. The hydrocarbons present in the soil do not appear to pose a threat to public health and the environment.

5.0 ENVIRONMENTAL SETTING

The UCP pipe manufacturing facility is located on approximately 74 acres of land situated immediately southwest of the Santa Fe Dam and east of the San Gabriel River Channel. It is bounded on the south by Live Oak Avenue, and on the northeast by Arrow Highway. Ground surface elevations at the site range from approximately 410 to 425 feet mean sea level (MSL).

The facility is situated in the north-central area of the San Gabriel Valley Groundwater Basin, and overlies fresh-water-bearing deposits of that basin. The basin is an

elongated, alluvium-filled valley extending from the central part of Los Angeles County almost to its eastern boundary. The valley, which is approximately 14 miles wide, is bordered on the north by the San Gabriel Mountains and on the south by the Repetto, Puente, and San Jose hills. A topographic divide marks the eastern boundary of the basin, and the Raymond Fault serves as the northwestern boundary. The surface area of the valley floor is approximately 100,000 acres.

Average annual precipitation in the site vicinity is approximately 14 inches, although rainfall in the San Gabriel Mountains, to the north, exceeds 35 inches annually at the higher elevations. Because these mountains are composed primarily of non-water-bearing rock, local precipitation in the mountains runs off through San Gabriel Canyon, providing sources of recharge to the water-bearing deposits underlying the valley floor in the vicinity of the site. The region's groundwater gradient from the mouth of San Gabriel Canyon is to the south and west.

The principal drainage in the area is the San Gabriel River, located immediately west of the site. The river banks are lined with concrete; the river bottom consists of native alluvial sand and gravel deposits.

The surface deposits in the site area are recent alluvium deposited by the San Gabriel River. These deposits overlie older alluvium. The central portion of the San Gabriel Valley Groundwater Basin has water-bearing deposits averaging about 1,000 feet in thickness. The alluvium that comprises the water-bearing materials in the site vicinity consists of randomly sorted, subrounded to well-rounded, coarse-grained deposits derived from the San Gabriel Mountains to the north. The deposits range in size from silts to 4-foot-diameter

boulders. The alluvium generally consists of coarse sands and gravels, with occasional layers or lenses of finer-grained material deposited during low-flow cycles.

The coarseness of the sands and gravels in the alluvial deposits makes these deposits ideal aquifers. Horizontal permeabilities of these deposits range from about 100 to 500 gallons per day per square foot, although vertical permeabilities are generally an order of magnitude lower than the horizontal values. The existence of a perched water-bearing zone above the primary groundwater basin at the site is unlikely, due to the coarse-grained nature of the soil.

Groundwater levels in the vicinity of the site fluctuate greatly depending on the frequency and quantity of precipitation. A well installed at the UCP facility encountered water at approximately 170 feet below ground surface.

6.0 FACTORS RELATED TO KNOWN OR POTENTIAL SITE CONTAMINATION

6.1 Contaminant Characteristics

Results of the site investigation indicated that most of the chemicals present in the soil are a result of surface spillage from the manufacturing of concrete pipes, and seem to be confined to the top 1 foot of soil. Near the pour line, petroleum hydrocarbons (C_8-C_{35}) have migrated to a depth of up to 24 feet below the ground surface.

The hydrocarbons found at the pour line are likely form oil which was used as a release agent for concrete pipe forms. Mineral oil is generally a refined liquid petroleum product of moderate carbon chain length and high flash point. It contains easily biodegradable compounds.

According to its MSDS, mineral oil has negligible water solubility and no potential carcinogenic properties. This material thus has low potential to form leachate with infiltrating water. Analytical results indicate that the hydrocarbon-contaminated soil at the pour line would not be classified as a hazardous waste. In addition to the form oil, a small amount of hydraulic fluid is known or suspected to be present in the soil at some locations. According to the MSDS (Appendix B), the petroleum-base oil for the hydraulic fluid does not require a cancer warning, nor is it classified as a potential carcinogen to humans. Similar in overall nature to mineral oil, it has a high flash point and contains easily biodegradable compounds.

6.2 Critical Habitat, Sensitive Environment, and Endangered Species

Recent aerial photographs and the Baldwin Park 7.5-minute USGS topographic quadrangle indicate the nearest wetland area to be located directly across the Santa Fe Drain in the Santa Fe Flood Control Basin and Recreation Area. The 1956 and 1969 aerial photographs, however, do not indicate wetlands in this region. Other surrounding land uses within a 2-mile radius do not indicate wetland areas; these properties are primarily developed for industrial or residential use.

The nearest surface water recreational use area is located approximately 1/2 mile to the north, at the Santa Fe Dam Recreation Area, which is up gradient of the subject site.

Although no contaminants are expected to migrate off site, the California Fish and Game Natural Diversity Data Base (NDDB, 1989) was utilized to identify sensitive species within a 2-mile radius of the site. Sensitive species or ecosystems identified by the NDDB include:

- Western Yellow-Billed Cuckoo: The legal status of this species is defined as a Federal candidate 2 and California endangered species. The cuckoo was observed next to the San Gabriel River at El Monte, approximately 2 miles south of the site.

- Parish's Gooseberry: This species has no legal status, but it is noted by the NDDB as a sensitive species and was observed next to the San Gabriel River at El Monte, approximately 2 miles south of the site.

USGS topographic quadrangles do not indicate a critical habitat for sensitive, threatened, or endangered species within a 1-mile radius of the site. However, a recent aerial photograph and the USGS quadrangles indicate a freshwater wetland area located directly across the Santa Fe Drain in the Santa Fe Flood Control and Recreation Area.

The Baldwin Park and Azusa USGS topographic quadrangles do not indicate national/state parks, forests, wildlife reserves, or historic/landmark sites within 2 miles of the site. The USGS quadrangles and a recent aerial photograph do indicate a large residential area in the City of Baldwin Park located to the south and adjacent to the site, and another residential area approximately 1 mile northwest of the site in the City of Monrovia.

6.3 Exposure Routes and Toxicity

Under the existing condition, the major exposure route of the surface soil containing petroleum hydrocarbons to humans would be through inhalation and dermal contact of fugitive dust. The mechanism associated with this exposure route would be wind dispersion. Release of dust into the atmosphere would be intermittent on windy days. This release was mitigated at UCP by paving the facility and by use of water

sprinkler systems. Because of the semi-closure status and limited operations at the facility, exposure to humans through dermal contact would be minimal.

Occasionally, surface runoff that carries soil to the settling ponds may occur, particularly during heavy rains. Petroleum hydrocarbons may be released to the pond water. Petroleum hydrocarbons in the subsurface soil at the pour area may migrate vertically toward the groundwater. However, considering the low solubility of the hydrocarbons and the depth to the groundwater (approximately 170 feet), the potential for these hydrocarbons to impact the groundwater (and resultant health risks) would be insignificant.

The relative toxicity of mineral oil in soil via inhalation or dermal contact would be low. Mineral oil has an ACGIH TLV/TWA or OSHA PEL value of 5 mg/m^3 for oil mist. It does not contain carcinogens or potential carcinogens. No health or cleanup standards have been established for mineral oil.

In summary, based on the characteristics of mineral oil, the vertical extent of hydrocarbon-contaminated soil, and the depth to groundwater, it is concluded that the hydrocarbons present in the soil at the pour line do not pose a threat to public health and the environment. As a result, factors related to soil/direct contact pathways, and factors related to water and air pathways are not addressed in this PEA.

7.0 ANALYSIS OF PATHWAYS FOR HAZARD POTENTIAL DETERMINATION

The UCP manufacturing facility, in its present condition, does not pose a threat to public health and the environment. Operations at the facility have essentially ceased during the last 6 months. This would greatly reduce the potential for

exposure of onsite workers to dust. Proposed site development would include light industrial and office buildings and paved parking lots.

Release of hydrocarbon-contaminated soil at the facility may occur through air dispersion and surface runoff (to settling ponds on site) pathways. Release of mineral oil from soil to groundwater is essentially nil based on the site investigation findings and regional hydrogeologic setting.

7.1 Air Dispersion Pathway

Although almost the entire area of the facility is paved, inhalation and dermal contact of dust may occur, particularly on windy days. Potential dust release was mitigated by use of sprinkler systems when the facility was in operation. Fugitive dust may be released during demolition and construction for the proposed development. However, dust would be mitigated by daily watering the excavation area or the entire site, as needed. Once the site development is completed, the potential for exposure to dust through air dispersion would be eliminated.

7.2 Surface Runoff Pathway

Surface runoff was collected in settling ponds located on the western corner of the property. Analysis of water samples from these ponds did not detect volatile organic compounds. The sediment samples did not contain elevated concentrations of metals or volatile halocarbons. Thus, potential adverse impact on the environment and wildlife from surface runoff would be insignificant.

7.3 Groundwater Pathway

Given the depth to groundwater (approximately 170 feet), it is unlikely that the hydrocarbons present in the soil will

reach groundwater, considering that they have penetrated only a maximum of approximately 24 feet after three to five decades of movement. Groundwater samples from monitoring wells in the site vicinity (and the well on site) have shown no detectable hydrocarbon concentrations. Activities that historically released mineral oil to the soil have ceased, so no additional inputs will occur.

7.4 Fire and Explosion Hazards

The majority of the materials such as aggregates, cement, and steel used in the manufacturing of concrete pipes are inert. Further, the soil at the pour line has been shown to be nonflammable. Thus, no known fire or explosion hazards exist at the facility.

8.0 COMMUNITY ASSESSMENT

UCP has been at the same location conducting the same business for almost 53 years. Because there has been no reported release of hazardous substance and fuels and the facility has AQMD permits for dust emissions, no complaints have been filed at the regulatory agencies against UCP. The Los Angeles County Department of Health Services, Cities of Irwindale and Baldwin Park, and their fire departments have expressed no interest or concern regarding UCP. In fact, the City of Irwindale is encouraged by the proposed site development and is participating in this site development project.

9.0 CONCLUSIONS

Based on the data and information presented in this PEA, the following conclusions can be drawn:

- UCP has been operating at this site for almost 53 years and is in the process of closing down and selling the property.

- Past and present operations have resulted in the surface spillage of petroleum hydrocarbons at a few areas on site. However, the concentration levels of petroleum hydrocarbons (as measured by EPA Method 418.1) in soil are low (less than 1,000 ppm), except at the pour line.

- Mineral oil, a release agent for concrete pipe form, has penetrated to a depth of up to 24 feet below the ground surface at the pour line. It is improbable, however, that this form oil would migrate to the groundwater (which is estimated at 170 feet deep), because it has moved only about 25 feet over a period of 30 to 50 years, and the source has now been removed.

- The mineral oil has no carcinogenic properties. The soil containing mineral oil at the pour line is not a hazardous waste per Title 22 of the California Administrative Code. Public exposure to this material would be primarily through inhalation and dermal contact of dust on windy days.

- UCP has ceased its concrete pipe manufacturing activities. The facility is essentially closed, with structures, equipment, concrete pipes, and pavements to be dismantled and/or removed prior to site development. A small amount of steel fabrication was being conducted on site at the time of a site visit on 12 June 1990.

- The Koll Company plans to develop approximately 55 acres of the property. The City of Irwindale is purchasing the remaining 17 acres for a retail development. The Koll Company intends to install site improvements, including interior streets, sewers, water, utilities, storm drains, and perimeter and street frontage landscaping. By early 1991, The Koll Company will have divided the property into parcels of varying sizes for construction. The proposed construction would be light industrial and office buildings. Current development plans will result in the construction of roads and/or buildings in the areas currently occupied by the pond on the west side of the property and by the pour line.

Boiling Point	>212°F (estimated)	Specific Gravity (H_2O = 1)	~1.2
Vapor Pressure (mm Hg.)	20	% Volatiles by volume	60% water
Vapor Density (AIR = 1)	(N. A.)	Evaporation Rate (Butyl Acetate = 1)	Equal to water
Solubility in Water	Complete	pH of 1% solution	7.5 - 11.5

Appearance and Odor: Dark brown liquid with slight moth-ball naphthalene odor.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

Flash Point (Method Used): > 200°F (estimated)

Flammable Limits: N. A. LEL: N. A. UEL: N. A.

Extinguishing Media: Product is an aqueous solution and is unlikely to burn until all water is evaporated.

Special Fire Fighting Procedures: None.

Unusual Fire and Explosion Hazards: None Known.

SECTION V - REACTIVITY DATA

Stable: X

Conditions to Avoid: None Known.

Incompatability (Materials to Avoid): None Known

Hazardous Decomposition or Byproducts: If product is dried and burned, oxides of carbon and sulfur may evolve.

Hazardous Polymerization: Will not occur.

Conditions to Avoid: None Known.

SECTION VI - HEALTH HAZARD DATA

(Include all known acute and chronic effects, signs, and symptoms of exposure and medical conditions generally aggravated by exposure)

Routes of Exposure:

Inhalation:

Exposure by inhalation not expected to occur unless specific use generates a localized mist. If inhaled as a mist, may cause slight irritation to the upper respiratory tract.

SECTION VI - HEALTH HAZARD DATA (Cont'd)

Skin and Eye:

Contact with the alkaline solution may cause eye burns and skin irritation. Dermal LD_{50} rabbit for similar products is 16,000 mg/kg.

Ingestion:

Alkaline solution may cause burns to the gastrointestinal tract if swallowed. Systemic toxicity is low. Oral LD_{50} rat for similar products is 3,800 mg/kg.

Carcinogenicity According to NTP, IARC and OSHA:

This product contains a level of formaldehyde below the level where labeling would be required by the OSHA Hazard Communication Standard (29 CFR §1910.1200). Formaldehyde is considered a possible carcinogen based on tests with laboratory animals.

Emergency and First Aid Procedures:

If inhaled and irritating symptoms develop, move to fresh air. If symptoms persist, consult a physician.

In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. See a physician. Flush skin with water immediately. Call a physician if skin shows signs of irritation. Wash clothing before re-use.

If swallowed, give large amounts of water or milk to drink. Do not induce vomiting. Call a physician immediately. Never give anything by way of mouth to an unconscious person.

SECTION VII - PRECAUTIONS FOR SAFE HANDLING AND USE

Warning Statements:

DANGER! ALKALINE SOLUTION MAY CAUSE EYE BURNS AND SKIN IRRITATION.

- Contains Calcium Naphthalenesulfonate Formaldehyde Copolymer (CAS# 37293-74-6).
- Swallowing liquid may cause burns to gastrointestinal tract.
- May be irritating to nose and throat if inhaled as mist.

Precautionary Measures:

- Do not get in eyes, on skin, or on clothing.
- Wash thoroughly after handling.
- Avoid breathing mist. Use with adequate ventilation.
- Keep container closed.

Steps to be Taken in Case Material is Released or Spilled:

Prevent product from entering drinking water supplies or streams. Observing precautions above, collect liquid or solidify liquid with an inert, noncombustible material and remove for disposal.

SECTION VII - PRECATIONS FOR SAFE HANDLING AND USE (Cont'd)

Waste Disposal Method:

According to the EPA (40 CFR § 261.3), waste of this product is not defined as hazardous. Solidification must be accomplished prior to disposal in a landfill. Dispose of all waste in accordance with local, state and federal government regulations.

SECTION VIII - CONTROL MEASURES

Respiratory Protection (Specify Type):

Not generally required. If specific use generates a mist, use of a half-face mask with a prefilter for mist or dust is recommended. Consult respirator manufacturer for appropriate type.

Ventilation

Local Exhaust: Not generally required.

Mechanical: Yes

Special: N. A.

Other: N. A.

Protective Gloves: Impervious rubber gloves should be worn.

Eye Protection: Wear goggles to protect against splashing.

Other Protective Clothing or Equipment: Wear appropriate clothing to prevent skin contact.

Work/Hygenic Practices: Note precautions above.

"THE DATA INCLUDED HEREIN ARE PRESENTED ACCORDING TO W. R. GRACE & CO.'S PRACTICES CURRENT AT THE TIME OF PREPARATION HEREOF, ARE MADE AVAILABLE SOLELY FOR THE CONSIDERATION, INVESTIGATION AND VERIFICATION OF THE ORIGINAL RECIPIENTS HEREOF AND DO NOT CONSTITUTE A REPRESENTATION OR WARRANTY FOR WHICH GRACE ASSUMES LEGAL RESPONSIBILITY. DAREX · CONCRETE ADMIXTURES

RECEIVED
DEWELL MORGAN

MAY 1 4 1987

DESCRIPTION:

WRDA®-19 is a high range water-reducer, commonly referred to as a superplasticizer. It is an aqueous solution of a modified naphthalene sulfonate. It is a low viscosity liquid which has been formulated by the manufacturer for use as received. WRDA-19 contains no added chloride. WRDA-19 is formulated to comply with specifications for Chemical Admixtures for Concrete, ASTM Designation: C-494 as a Type A, or as a Type F admixture.

One gallon of WRDA-19 weighs approximately 10 lbs.

DISPERSION:

WRDA-19 is a superior dispersing admixture having a marked capacity to disperse the cement agglomerates normally found in a cement-water suspension. The capability of WRDA-19, in this respect, exceeds that of normal water reducing admixtures.

USES:

WRDA-19 produces concrete with extremely workable characteristics referred to as high slump, flowing concrete. WRDA-19 also allows concrete to be produced with very low water/cement ratios at low or normal slumps.

WRDA-19 is ideal for use in prestress, precast, bridge deck or any concrete where it is desired to keep the water/cement ratio to a minimum and still achieve the degree of workability necessary to provide easy placement and consolidation. WRDA-19 will also fluidize concrete making it ideal for tremie concreting or other applications where high slumps are desired.

ADVANTAGES:

1. WRDA-19 can produce high slump flowable concrete at no loss in strength.
2. WRDA-19 can produce low water/cement ratio concrete and therefore, high strengths.
3. WRDA-19, in prestress/precast work, can be used to substantially reduce or eliminate the high energy requirements of external heat for accelerated curing.
4. WRDA-19 concrete produced with Type I cement may be substituted for normal concrete produced with Type III cement to achieve early release strengths.
5. WRDA-19 concrete, even at high slump, exhibits no significant segregation in comparison to concrete without a superplasticizer at the same slump.
6. WRDA-19 aids in rapid discharge of concrete from truck mixers thereby reducing on the job time and improving mixer utilization.

ADDITION RATES:

Addition rates of WRDA-19 can vary with type of application, but will normally range from 6 fluid ounces to 20 fluid ounces per 100 lbs of cement. In most instances the addition of 10 to 16 fluid ounces per 100 lbs. of cement will be sufficient. At a given water/cement ratio, the slump required for placement can be controlled by varying the addition rate.

COMPATIBILITY:

In concrete containing WRDA-19, the use of a Vinsol resin air entraining agent (such as DARAVAIR®) is recommended to provide suitable air void parameters for resistance against freeze-thaw attack.

Most Type A water reducers or Type D water reducing retarders are compatible with WRDA-19 as long as they are separately added to the concrete. Pretesting of the concrete should be performed to optimize dosages and addition times of these admixtures. Caution should be exercised when using WRDA-19 together with a retarder, as excessive retardation can occur if the admixture dosages are too high.

Pretesting of the concrete should be performed to determine dosages and addition times of these admixtures. The admixtures should not contact each other before they enter the concrete.

PACKAGING:

WRDA-19 is available in bulk, delivered by metered tank trucks, and in 55 gallon drums. WRDA-19 contains no flammable ingredients.

It will begin to freeze at approximately 32° F, but will return to full strength after thawing and thorough agitation.

In storage, and for proper dispensing, WRDA-19 should be maintained at temperatures above 32°F.

Material Safety Data Sheet

CHEVRON AW Hydraulic Oil 68

UNITED CONCRETE PIPE CORP
PO BOX 429
BALDWIN PARK, CA 91706
Print Date: November 26, 1989

MATERIAL ORDERED FOR:
14041 EAST LIVE OAK AVE
BALDWIN PARK, CA 91706

This Material Safety Data Sheet contains environmental, health and toxicology information for your employees. Please make sure this information is given to them. It also contains information to help you meet community right-to-know/emergency response reporting requirements under SARA Title III and many other laws. If you resell this product, this MSDS must be given to the buyer or the information incorporated in your MSDS. Discard any previous edition of this MSDS.

The Chevron MSDS has been revised to include a first aid statement for the accidental injection under the skin.

1. PRODUCT IDENTIFICATION

CHEVRON AW Hydraulic Oil 68

- A HAZARD WARNING IS NOT REQUIRED FOR THIS PRODUCT UNDER OSHA HAZARD COMMUNICATION STANDARD (29 CFR 1910.1200)

CHEVRON PRODUCT NUMBER(S): CPS234228
PRODUCT INFORMATION: (800)582-3835

Revision Number: 11 Revision Date: 11/18/89 MSDS Number: 000080
NDA - No Data Available NA - Not Applicable

Prepared According to the OSHA Hazard Communication Standard (29 CFR 1910.1200) by the Chevron Environmental Health Center, Inc., P.O. Box 4054, Richmond, CA 94804.

2. FIRST AID

EYE CONTACT:
No first aid procedures are required. However, as a precaution flush eyes with fresh water for 15 minutes. Remove contact lenses if worn.
SKIN CONTACT:
No first aid procedures are required. As a precaution, wash skin thoroughly with soap and water. Remove and wash contaminated clothing.

Note to Physician: Injection under the skin of materials similar to this product is associated with accidents involving high-pressure equipment. When ejected from this type of equipment, the material can easily penetrate the skin and leave a small, sometimes bloodless, puncture wound. Yet, because of its driving force, material injected into a fingertip can be deposited into the palm of the hand. Within 24 hours, there is usually a great deal of swelling, discoloration, and intense throbbing pain in the affected part. Immediate treatment at surgical emergency center is recommended.
INHALATION:
Since this material is not expected to be an immediate inhalation problem, no first aid procedures are required.
INGESTION:
If swalloved, give water or milk to drink and telephone for medical advice. Consult medical personnel before inducing vomiting. If medical advice cannot be obtained, then take the person and product container to the nearest medical emergency treatment center or hospital.

3. IMMEDIATE HEALTH EFFECTS

EYE CONTACT:
This substance is not expected to cause prolonged or significant eye irritation. This hazard evaluation is based on the data from similar materials.
SKIN IRRITATION:
This substance is not expected to cause prolonged or significant skin irritation. This hazard evaluation is based on data from similar materials.
DERMAL TOXICITY:
The systemic toxicity of this substance has not been determined. However, it should be practically non-toxic to internal organs if it gets on the skin. This hazard evaluation is based on data from similar materials.
RESPIRATORY/INHALATION:
The systemic toxicity of this substance has not been determined. However, it should be practically non-toxic to internal organs if inhaled. This hazard evaluation is based on data from similar materials.
INGESTION:
The systemic toxicity of this substance has not been determined. However, it should be practically non-toxic to internal organs if swallowed. This hazard evaluation is based on data from similar materials.

4. PROTECTIVE EQUIPMENT

EYE PROTECTION:
No special eye protection is usually necessary.
SKIN PROTECTION:
No special skin protection is usually necessary. Avoid prolonged or frequently repeated skin contact with this material. Skin contact can be minimized by wearing protective clothing.
RESPIRATORY PROTECTION:
No special respiratory protection is normally required. However, if operating conditions create airborne concentrations which exceed the recommended exposure standards, the use of an approved respirator is required.
VENTILATION:
Use adequate ventilation to keep the airborne concentrations of this material below the recommended exposure standard.

5. FIRE PROTECTION

FLASH POINT: (COC) 428F (220C)
AUTOIGNITION: NDA
FLAMMABILITY: NA
EXTINGUISHING MEDIA:
CO2, Dry Chemical, Foam and Water Fog.
NFPA RATINGS: Health 0; Flammability 1; Reactivity 0; Special NDA;
HMIS RATINGS: Health 0; Flammability 1; Reactivity 0; Other NDA;
(Least-0, Slight-1, Moderate-2, High-3, Extreme-4). These values are obtained using the guidelines or published evaluations prepared by the National Fire Protection Association or, if applicable, the National Paint and Coating Association, and do not necessarily reflect the hazard evaluation of the Chevron Environmental Health Center. Read the entire document and label before using this product.
FIRE FIGHTING PROCEDURES:
For fires involving this material, do not enter any enclosed or confined fire space without proper protective equipment, including self-contained breathing apparatus.
COMBUSTION PRODUCTS:
Normal combustion forms carbon dioxide and water vapor and may produce oxides of sulfur and phosphorus. Incomplete combustion can produce carbon monoxide.

6. STORAGE, HANDLING, AND REACTIVITY

HAZARDOUS DECOMPOSITION PRODUCTS:
NDA.
STABILITY:
Stable.

HAZARDOUS POLYMERIZATION:
Polymerization will not occur.
INCOMPATIBILITY:
May react with strong oxidizing agents, such as chlorates, nitrates, peroxides, etc.
SPECIAL PRECAUTIONS:
CAUTION! Do not use pressure to empty drum or explosion may result. DO NOT weld, heat or drill container. Replace cap or bung. Emptied container still contains hazardous material which may ignite with explosive violence if heated sufficiently.

7. PHYSICAL PROPERTIES

SOLUBILITY: Soluble in hydrocarbon solvents; insoluble in water.
APPEARANCE: Pale yellow liquid.
BOILING POINT: NA
MELTING POINT: NA
EVAPORATION: NA
SPECIFIC GRAVITY: 0.88 @ 15.6/15.6C
VAPOR PRESSURE: NA
PERCENT VOLATILE (VOLUME %): NA
VAPOR DENSITY (AIR=1): NA
VISCOSITY: 61 cSt @ 40C (Min.)

8. SPILL RESPONSE AND DISPOSAL

CHEMTREC EMERGENCY PHONE NUMBER: (800) 424-9300 (24 hour).
SPILL/LEAK PRECAUTIONS:
This material is not expected to present any environmental problems other than those associated with oil spills.

Stop the source of the leak or release. Clean up releases as soon as possible. Contain liquid to prevent further contamination of soil, surface water or groundwater. Clean up small spills using appropriate techniques such as sorbent materials or pumping. Where feasible and appropriate, remove contaminated soil. Follow prescribed procedures for reporting and responding to larger releases.
DISPOSAL METHODS:
Place contaminated materials in disposable containers and dispose of in a manner consistent with applicable regulations. Contact local environmental or health authorities for approved disposal of this material.

9. EXPOSURE STANDARDS, REGULATORY LIMITS AND COMPOSITION

COMPOSITION COMMENT:

All the components of this material are on the Toxic Substances Control Act Chemical Substances Inventory.

Based upon information reviewed to date, this product fits the ACGIH definition for mineral oil mist. The ACGIH TLV is 5mg/m3, the OSHA PEL is 5mg/m3.

The percent compositions are given to allow for the various ranges of the components present in the whole product and may not equal 100%.

PERCENT/CAS# COMPONENT/REGULATORY LIMITS

100.0 % CHEVRON AW Hydraulic Oil 68

CONTAINING

> 99.0 % LUBRICATING BASE OIL

The BASE OIL may be a mixture of any of the following: CAS 64741884, CAS 64741895,CAS 64741964,CAS 64741975,CAS 64742014,CAS 64742525, CAS 64742536,CAS 64742547,CAS 64742627,CAS 64742650,CAS 72623837.

12. ADDITIONAL HEALTH DATA

ADDITIONAL HEALTH DATA COMMENT:
This product contains petroleum base oils which may be refined by various processes including severe solvent extraction, severe hydrocracking, or severe hydrotreating. None of the oils require a cancer warning under the OSHA Hazard Communication Standard (29 CFR 1910.1200). These oils have not been listed in the National Toxicology Program (NTP) Annual Report nor have they been classified by the International Agency for Research on Cancer (IARC) as; carcinogenic to humans (Group 1), probably carcinogenic to humans (Group 2A), or possibly carcinogenic to humans (Group 2B).

Division of U.S. Pipe & Foundary
P.O. Box 429
Baldwin Park, CA 91706

Dear Mr. Gobler:

HAZARDOUS MATERIALS UNDERGROUND STORAGE
APPLICATION FOR CLOSURE
FACILITY AT: 14041 Live Oak Ave.

Please find enclosed an Application for Closure forms per your request.

All existing underground tanks must be either closed or permitted. If the tanks are to be closed, complete the copy of the application form and return with the proper fee and required supporting information.

Soil sampling and analysis will be required for all closures. Soil borings will be required if the tank contained a volatile or semi-volatile priority pollutant, or an extremely hazardous material. A plot plan to scale showing location of tank(s), buildings, adjacent streets, north arrow and proposed soil sampling points must accompany the application forms.

If you have any questions concerning this matter, please contact Mr. Blair Burgess at (213) 226-4437.

Very truly yours,

T. A. TIDEMANSON

ATTENTION MR. FRITZ GOBLER

DEAR MR. GOBLER:

In regards to your request in procedures for abandonment or removal of underground storage tanks; Our department recognizes both removal and abandoning in place. However, the Department of County Engineer must be contacted first and their requirements complied with prior to Fire Department involvement.

The following are required procedures for Underground Tank Abandonment in place:

1. Obtain a permit, through the local Fire Prevention Office, for Abandonment in place and contact the local Inspector at least 48 hours in advance of the abandoning date.
2. Remove all flammable or combustible liquid from the tank and from all connecting lines.
3. Disconnect the suction, inlet, gauge and vent lines.
4. Fill the tank and any remaining stubs completely with an approved non-shrinking inert solid material and cap all tank inlets and outlets.

If you have any questions regarding these procedures and requirements please feel free to contact me at my office.

Very Truely yours,

JOHN W. ENGLUND, FIRE CHIEF

Attention Mr. Fritz Gabler P.E.

Dear Mr. Gabler:

In regards to the abandonment or removal of underground storage tanks. Our department recognizes both removal or abandoning in place. The Department of County Engineer must be contacted in either case and their requirments must be met prior to Fire Department involvement.

In the case of abandonment in place, as per your request, the following procedure is required by our department:

1. Remove all flammable or combustible liquid from the tank and from all connecting lines.

2. Disconnect the suction, inlet, gauge and vent lines.

3. Fill the tank and any remaining stubs completely with an approved non-shrinking inert solid material and cap all tank inlets and outlets.

Also a permit is required by this department and you must contact the local Fire Inspector at least 24 hours in advance of the date of abandonment.

If you have questions regarding this procedure, pleast feel free to contact me at my office.

Very truly yours,

JOHN W. ENGLUND, FIRE CHIEF

Dear Mr. Gobler:

HAZARDOUS MATERIALS UNDERGROUND STORAGE PERMIT (HMUSP)
LEAK DETECTION PROGRAM/TANK MONITORING PROGRAM (LDP/TMP)
IMPLEMENTATION REPORT
HMUSP NO. 157
FACILITY LOCATION: 14041 East Live Oak Avenue, Irwindale

This office has reviewed the LDP/TMP implementation report submitted on October 27, 1986 for the subject facility.

[x] In order better evaluate the report, the information indicated on the attached Additional LDP/TMP Reporting Requirements sheet must be submitted to this office by January 4, 1988.

[ ] Based on the information submitted, the implementation of the LDP/TMP meets this office's requirements. Further reporting requirements will be outlined in the operational permit which will be forwarded to you at a subsequent date.

[ ] Other:

If you have any questions regarding this matter, please contact Mr. Blair Burgess at (213) 226-4437.

Very truly yours,

(213) 458-3507

ADDITIONAL LDP/TMP REQUIREMENTS

The additional information or requirements checked below must be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 4089, Los Angeles, CA 90051, in order to complete evaluation of the LDP/TMP implementation report.

[ ] 1. Plot plan to scale showing locations of tanks and associated piping, boring and monitoring well locations, buildings, adjacent streets, and north arrow.

[ ] 2. Information pertaining to the tanks contradicts information previously submitted on the permit application form or hazardous substance storage statements. These contradictions must be corrected.

[ ] 3. Number and location of soil and/or groundwater samples is not adequate.

[ ] 4. Sampling protocol.

[ ] 5. Sample analysis method(s).

[ ] 6. Boring logs certified by a California registered geologist, California registered civil engineer with sufficient experience in soils, or a California certified engineering geologist.

[ ] 7. Documentation as to depth of groundwater at facility.

[ ] 8. Monitoring well specifications and cross section showing well construction.

[X] 9. Monitoring well specifications do not conform to Los Angeles County guidelines for the groundwater condition. Well heads must be installed to conform to Los Angeles County Guidelines.

[X] 10. Manufacturer and model number of monitoring sensor or device(s). (Certification of installation)

[ ] 11. Manufacturer and model number of pressure line monitoring system.

[ ] 12. Manufacturer and model number of overfill protection device.

[ ] 13. Tank integrity test results and data sheets.

[ ] 14. Manufacturer and model number of Tank Level Monitor (TLM) system.

[ ] 15. Details of inventory reconciliation or tank gauging procedures.

[X] 16. Other: Verify that the piping system for tank 4 is a suction system. A closure permit must be obtained for tank 8.

PROVISIONAL
HAZARDOUS MATERIALS UNDERGROUND STORAGE PERMIT
COUNTY OF LOS ANGELES
DEPARTMENT OF PUBLIC WORKS
WASTE MANAGEMENT DIVISION
2250 ALCAZAR STREET
LOS ANGELES, CALIFORNIA 90033

PERMIT NO. 157

EXPIRATION DATE OCT 12 1987

PERMISSION IS HEREBY GRANTED UNDER LACC TITLE 11, DIVISION 4 TO:

[redacted] <<<<<<<< FILE NUMBER
[redacted] <<<<<<<< PERMITTEE

[redacted] <<<<<<<< FACILITY ADDRESS

TO STORE HAZARDOUS MATERIALS IN UNDERGROUND TANK(S) LOCATED AT THE FACILITY ABOVE.

NUMBER OF PERMITTED TANKS: 6

THIS PROVISIONAL PERMIT IS SUBJECT TO THE FOLLOWING REQUIREMENTS:

PART A — GENERAL CONDITIONS AND LIMITATIONS (ATTACHED).

PART B — AUTHORIZED HAZARDOUS MATERIAL STORAGE TANKS (ATTACHED).

PART C — SPECIFIC CONDITIONS AND LIMITATIONS:

1. THE PERMITTEE SHALL SUBMIT FOR APPROVAL AND IMPLEMENT A LEAK DETECTION PROGRAM (LDP) AND A TANK MONITORING PROGRAM (TMP) PREPARED IN ACCORDANCE WITH "UNDERGROUND STORAGE OF HAZARDOUS MATERIALS - GUIDELINES FOR EXISTING FACILITIES, OCTOBER 1986."

2. THE FOLLOWING TIME SCHEDULE SHALL APPLY TO SUBMITTALS REQUIRED BY THIS PROVISIONAL PERMIT:

   a. PERMIT FEE DUE BY (SEE INVOICE) To Be Billed

   b. TANK INTEGRITY TEST RESULTS DUE BY JUL 10 1987

   c. PROPOSALS FOR LDP AND TMP DUE BY JUL 10 1987

3. PERMIT EFFECTIVE DATE 3/1/85
   NOTE: THE EFFECTIVE DATE IS DETERMINED BY ORIGINAL DATE OF PERMIT APPLICATION.

PART D — SPECIAL CONDITIONS AND LIMITATIONS ATTACHED. YES [X] NO [ ]

This Provisional Permit is valid only for the continued operation of tanks providing suitable storage and expires six (6) months from the date of issue. Permittee has until the expiration date to complete an approved LDP and to install and be in compliance with an approved TMP. Upon full compliance with the approved LDP and TMP and all other conditions and limitations, this Provisional Permit will be replaced by a full term Operational Permit for the remainder of the unexpired five (5) year term from the effective date unless otherwise noted in Part D above.

T. A. TIDEMANSON
DIRECTOR OF PUBLIC WORKS

BY _____ APR 10 1987
WASTE MANAGEMENT DIVISION

APR 13 1987

HCL

PP80: 10/86

HAZARDOUS MATERIALS UNDERGROUND STORAGE PERMIT

PART A — GENERAL CONDITIONS AND LIMITATIONS

TERM OF PERMIT

1. The combined provisional and full term operational permits shall be valid for a maximum period of five (5) years from the effective date. However, if the Department of Public Works (DPW) finds that the life expectancy of a facility is less than five (5) years, the DPW may adjust the term of the permit to reflect such a condition.

FEES

2. All fees shall be due and payable on the billing date established by the DPW. Fees not paid within 30 calendar days from the billing date shall be considered delinquent. Delinquent fees shall be subject to a 10 percent penalty fee for each 30 day period beyond the billing date that the fee is due. Permits for which the annual permit fee installment is delinquent for 90 days or more are subject to suspension.

REPORTS AND RECORDS

3. At least annually and due by the anniversary of the effective date of this permit, a written report must be submitted to the Department of Public Works, Waste Management Division, P.O. Box 4089 Terminal Annex, Los Angeles, CA 90051 detailing (but not limited to) the following:

   a. Any changes in the type of hazardous materials stored within the facility.

   b. Any changes in the uses of the underground facility.

   c. Changes or modifications to monitoring procedure.

   d. A detailed account of any unauthorized discharges, and the remedial measures employed.

   e. Any modifications to the facility except for routine required maintenance.

   In the event there has been no change of operation nor unauthorized release, a negative declaration to that effect may be submitted.

   The report or negative declaration shall be certified by the permittee or an authorized representative who is responsible for operations at the facility.

   This report is required by local agencies to satisfy Section 25286(c) of the State of California Health and Safety Code. A report form will be made available to owners and operators to comply with this requirement. The report shall be delinquent 30 days after its due date and as such may result in suspension or revocation of the permit.

4. Every permittee shall provide testing, monitoring (if applicable), and inspections in compliance with this permit and shall maintain records adequate to demonstrate compliance therewith.

5. All required records shall be maintained by the permittee and made available for inspection for a period of time not less than three (3) years from the date of the required annual report for the year during which the testing, monitoring or inspection was performed. Said records shall be made available to the DPW, County Health Officer or Forester and Fire Warden during normal working hours and at any time upon reasonable notice.

RENEWALS AND EXTENSIONS

6. If this is a provisional permit, it may be extended to a maximum of one (1) additional year upon written application stating the reasons for such a request and upon approval by the Director of Public Works.

7. Every application for the renewal of a operational permit or extension of a provisional permit shall be made at least 30 days prior to the expiration date of such permit. If a timely application for renewal has been submitted, the permit shall remain in effect until the DPW has made a decision and any administrative appeal has been exhausted.

APPEALS

8. Any person dissatisfied with the decision of the DPW may appeal the decision, in writing, to the Appeals Board, setting forth with particularity the ground or grounds for the appeal. Such appeal shall be submitted within 30 days after notice of the decision has been given.

ADDITIONAL APPROVALS AND REPAIRS

9. Additional approvals shall be required for any of the following actions:

   a. Tank repair.

   b. Modifications.

   c. Change or addition of hazardous materials stored.

   d. Change of approved monitoring system.

10. Procedures for an application for a permit shall also apply to an application for an additional approval. Each application for an additional approval shall be accompanied by the appropriate fee and supporting information.

11. Any substantial modification or repair of a facility other than minor repairs or emergency repairs shall be in accordance with plans to be submitted to the DPW as an additional approval.

12. Permittee shall carry out routine maintenance, ordinary upkeep and minor repairs in a careful and safe manner. No permit will be required for such maintenance, upkeep and repairs.

13. Permittee may make emergency repairs to a facility in advance of seeking an additional approval whenever an immediate repair is required to prevent or contain an unauthorized discharge or to protect the integrity of the containment. However, within five (5) working days after such emergency repairs have been started, permittee shall seek additional approval by submitting drawings or other information adequate to describe the repairs to the DPW.

CLOSURES, DECONTAMINATION AND NEW CONSTRUCTION

14. Replacement of tanks at an existing facility shall be considered a closure of the tanks to be replaced and a new installation of tanks, and all fees shall be assessed accordingly.

15. No tank shall be abandoned. Tanks which are temporarily out of service, and are intended to be returned to use, must continue to be monitored and inspected. Any tank which is not being monitored and inspected must be closed or removed in a manner approved by the DPW.

16. Prior to any permanent or temporary closures being initiated, an Application for Closure form, the appropriate fee and required supporting information shall be filed with the DPW.

17. Plans for the decontamination of a facility shall be submitted to the DPW for approval no later than 30 days before the commencement of such operations. Other agencies having jurisdiction shall also be notified. These agencies include the California Regional Water Quality Control Board, the Los Angeles County Department of Health Services and the South Coast Air Quality Management District.

18. The installation of a new tank shall require submittal to the DPW of an application for new construction, the appropriate new construction plan clearance fee and supporting information as required by the DPW.

TRANSFERS

19. A Hazardous Materials Underground Storage Permit may be transferred to a new owner of the same facility provided:

   a. The new owner accepts full responsibility for all obligations under this permit at the time of the transfer of the facility.

   b. The transfer shall be documented on a form provided by the DPW within 30 days of transfer of ownership.

   c. The appropriate fee is paid.

ADDITIONAL LDP/TMP REQUIREMENTS

The additional information or requirements checked below must be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 4089, Los Angeles, CA 90051, in order to complete evaluation of the LDP/TMP proposal.

[ ] 1. Plot plan to scale showing locations of tanks and associated piping, boring and monitoring well locations, buildings, adjacent streets, and north arrow.

[ ] 2. Information pertaining to the tanks contradicts information previously submitted on the permit application form or hazardous substance storage statements. These contradictions must be corrected.

[ ] 3. Number and location of soil and/or groundwater samples is not adequate.

[ ] 4. Proposed sampling protocol.

[ ] 5. Proposed sample analysis method(s).

[ ] 6. Boring logs certified by a California registered geologist, California registered civil engineer with sufficient experience in soils, or a California certified engineering geologist.

[ ] 7. Type of monitoring proposed is not appropriate for tank(s) number _____.

[ ] 8. Documentation as to depth of groundwater at facility.

[ ] 9. Monitoring well specifications and cross section showing well construction.

[ ] 10. Monitoring well specifications do not conform to Los Angeles County guidelines for the groundwater condition.

[ ] 11. Manufacturer and model number of monitoring sensor or device(s).

[ ] 12. Manufacturer and model number of pressure line monitoring system.

[X] 13. Manufacturer and model number of overfill protection device.

[ ] 14. Tank integrity test results and data sheets.

[ ] 15. Manufacturer and model number of Tank Level Monitor (TLM) system.

[ ] 16. Pressurized pipelines must be shown on the plot plan.

[ ] 17. Monitoring for pressurized pipelines is required.

[X] 18. Other: LDP/TMP for waste oil tank #8 is required

BOILER TANKS

HAZARDOUS MATERIALS UNDERGROUND STORAGE
CLOSURE PERMIT NO. 3361B
FACILITY LOCATION: 14041 E. LIVE OAK AVENUE

This office has reviewed the soil/groundwater assessment report submitted on NOV. 18, 1987 required as a part of the subject closure procedure. Based on the information submitted, we find that:

[x] The closure is final and no further action is required.

[ ] The soils removed during the tank excavation are unrestricted and may be used as backfill material. The closure is final and no further action is required.

[ ] Excavated soils may be a hazardous waste and are not suitable for fill material or disposal on-site. Contaminated soils must be manifested, transported and disposed of pursuant to Chapter 6.5, California Health and Safety Code, unless evidence is presented indicating that disposal is proper at a less restricted facility. Copies of completed manifests or other appropriate evidence indicating legal disposal shall be submitted to this office before this project can be considered closed.

[ ] The permanent closure of the tank(s) in place shall comply with requirements set by the local Fire Department. Verification must be submitted to this office indicating proper closure and completion of all work.

If you have any questions concerning this matter, please contact Ms. Nicole Long at (213) 226- 4010 .

Very truly yours,

T. A. TIDEMANSON

ADDITIONAL CLOSURE REQUIREMENTS

The additional information or requirements checked below must be submitted to the Los Angeles County Department of Public Works, Waste Management Division, P.O. Box 4089, Los Angeles, CA 90051, in order to complete the evaluation of Closure Permit No. 33618.

[ ] Plot plan to scale showing locations of tanks, sampling points, buildings, adjatent streets and north arrow.

[ ] Insufficient number of samples were obtained. Additional samples required in accordance with attached Closure Permit Requirements.

[ ] Describe method of obtaining, handling, and/or transporting samples.

[ ] Indicate time and date samples were obtained.

[ ] Submit logs certified by a CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils for all borings.

[ ] Submit chain-of-custody documentation initiated by person obtaining sample through person at DOHS certified laboratory.

[X] Disposal destination of tanks and evidence of legal disposal.

[ ] Analysis results by a State certified laboratory shall be submitted on laboratory letterhead showing analysis date, methods of extraction and methods of analysis.

[ ] Documentation as to depth of groundwater at facility.

[ ] Manifests to document hazardous waste disposal of removed soil.

[ ] Signature on the report is required of CA Registered Geologist, CA Certified Engineering Geologist, or CA Registered Civil Engineer with sufficient experience in soils.

[ ] Define the vertical and lateral extent of contamination.

[ ] Propose a remedial action plan to mitigate contamination.

[X] Other Please include either the triple rinse or tank hazardous waste manifest.

1.0 INTRODUCTION

1.1 PURPOSE OF SCOPE OF WORK

This report summarizes underground storage tank removals and soil sampling operations performed at United Concrete Pipe Division (United). The subject site is located at 14041 East Live Oak Avenue, Baldwin Park, Los Angeles County, California

The work accomplished under Los Angeles County Permit No. 3361-B, on October 14, 1987 consisted of the removal of three diesel fuel underground storage tanks, and collection and quantitative analyses of 6 soil samples, used to document subsurface soil conditions.

United engaged the services of Rudy's Service Station Equipment Maint., Inc. (Rudy's) to perform the excavation and removal of the underground storage tanks. Western Environmental Services (WES) was employed under verbal agreement by Rudy's to: 1) collect soil samples from beneath the bottom of each tank and 2) prepare this report on tank removal operations. Included herewith are discussions on field procedures, laboratory testing, and analytical results for soil samples recovered during the excavation and subsequent tank removals.

2.0 FIELD PROCEDURES

On October 14, 1987, under the supervision of Los Angeles County Fire Department, three underground diesel fuel storage tanks were removed and disposed of properly. The tank numbers, capacities and contents as determined by field personnel are summarized in Table 1.

TABLE 1
SUMMARY OF UNDERGROUND STORAGE TANKS DATA
UNITED CONCRETE

TANK NO.	CAPACITY (gals.)	CONTENTS
1	10,000	Diesel
2	8,000	Diesel
3	8,000	Diesel

Following the removal of the tanks, six soil samples (1A, 1B, 2A, 2B, 3A, 3B) were collected at a depth of two feet below tank bottom by a WES geologist. Sample locations are shown on Figure 1 - Site Plan.

The samples were recovered from the excavations using a back hoe and quickly placed by hand into four ounce glas sample jars, sealed with a teflon-lined lid, each sample within labeled and immediately stored on ice in an ice chest until transport to the laboratory. WES chain-of-custody procedures were followed to ensure the integrity of samples submitted for analyses.

3.0 GEOLOCY

The United site overlays alluvial sediments, gravels and cobbles interbedded with coarse grained sands of recent age. The elevation of the tank pit areas is approximately 400 feet above seal level; the surrounding topography slopes gently to the South. A review of California Department of Water Resources (DWR) records indicate the first principle aquifer beneath the site is greater than 100 feet below the surface; semi-perched zones may occur at shallower depths.

4.0 LABORATORY TESTING AND RESULTS

All samples were submitted for analyses to Chemical Research Laboratories, Stanton, California. Samples were tested for total recoverable hydrocarbons according to E.P.A. method 418.1. The sample is extracted using a horn-type sonicator and examined by infrared spectroscopy. Laboratory certificate and chain-of-custody records are included in Appendix A and B respectively.

Based on laboratory results for samples collected, it appears hydrocarbon leakage has occurred at the site. Sample reference numbers, locations and test results (in parts per million) are summarized in Table 2.

TABLE 2
SUMMARY OF SOIL SAMPLING
D&K CONCRETE

SAMPLE NO.	LOCATION	E.P.A. 418.1 (ppm)
1A	Southside of northern diesel tank	100
1B	Northside of northern diesel tank	ND(1)
2A	Southside of southeast diesel tank	15
2B	Northside of southeast diesel tank	1[illegible]0
3A	Southside of southwest diesel tank	ND(1)
3B	Northside of southwest diesel tank	6

5.0 CONCLUSIONS

In accordance with both State and County Guidelines for Underground Storage of Hazardous Materials, WES has completed a field sampling program associated with the removal of underground fuel tanks at the United facility. The results of field study indicates relatively low concentration of petroleum based hydrocarbons have leaked into the soil at the tank pit locations. Due to the deep groundwater table and dense conglomeratic subsurface soil conditions, we recommend United following regulatory approval backfill, compact and resurface the existing excavation.

If we can be of further assistance or provide further information, feel free to call.

Sincerely

Western Environmental Services

Dear Mr. Amoah:

In accordance with State and Local laws, enclosed is a copy of the underground tank closure and site accessment report from Brown and Caldwell Consulting Engineers for the Baldwin Park Plant. The contents of the report for this site seem to be self explanatory. In light of the limited contamination levels, and deep ground water we request authorization to backfill, and complete the closure at this location.

Your prompt attention would be appreciated, and if there is any additional information I can supply to expedite the process, please contact me.

Very truly yours,

Subject: Soil Sample Analysis for
United Concrete Pipe Company at
14041 Live Oak Drive
Baldwin Park, California

Dear Mr. Gobler:

Attached is a copy of the subject United Concrete Pipe Division site plan (Attachment A) located in Baldwin Park, California. Also attached are the report of analytical results (Attachment B) for five soil samples taken at the site, a copy of the Chain-of-Custody Record for the samples (Attachment C), and a sketch showing where the samples were taken (Attachment D).

Five soil samples were obtained from a three tank excavation on December 17, 1986. Two 10,000 gallon fuel tanks were pulled initially, on December 11,1986, with a verbal authorization from the County of Los Angeles Fire Prevention Division located on 125 South Baldwin Avenue. Soil samples were not obtained that day because equipment was not available to collect soil from the bottom of the excavation pit. The third, 1,000 gallon fuel tank was removed on December 17, 1986 in the presence of Michael Saemz of the County of Los Angeles Fire Prevention Division.

Soil samples were obtained by using a clam bucket digger on a 15-10 crane to collect soil at an approximate depth of three feet below where each tank was positioned. Each sample was then collected in a 2-inch diameter brass tube using a hand shovel. The brass tubes were capped with a teflon liner and plastic cap, sealed around the edge of the cap with electrical tape, then placed on ice for storage and transport to the laboratory.

Two soil samples were collected for both the 10,000 gallon regular and the 1,000 gallon gasoline fuel tanks. Only one sample was obtained for the 10,000 gallon diesel tank because the east sidewall to that tank contained a full 10,000 gallon fuel tank which would be in danger of sliding into the pit if excavation continued on the southeast side. Each sample was analyzed for petroleum hydrocarbons using EPA Method 8015. Total fuel hydrocarbon concentrations in the five samples ranged from less than 10 to 560 mg/kg.

A review of the available information indicates groundwater is located approximately 200 feet below the United Concrete site (verbal, Los Angeles Public Works, Loleta Amandy and Bulletin No. 104-2, Planned Utilization of Groundwater Basins - San Gabriel Valley, DWR). The soils beneath the site consist of recent and older alluvium deposits to an approximate depth of 2,500 feet (Bulletin No. 104-2, DWR). These deposits consist predominantly of coarse sands, gravels and boulders which were deposited along the San Gabriel River Channel.

I trust this letter meets your requirements at the present time. If you have any questions, please contact me.

Very truly yours,

BROWN AND CALDWELL

Garage Waste Oil Sump and 3,000 Gallon Tank

UNITED
CONCRETE PIPE
CORPORATION

August 2, 1989

County of Los Angeles
Department of Public Works
Waste Management Division
900 S. Fremont Avenue
Alhambra, CA 91803-1331

Attention: John Awuja

Dear John:

Here is a chronology of events concerning the removal of the 500 gallon concrete sump and 3000 gallon steel tank that had been used for waste oil collection and storage.

4-10-87	HMUSP No. 157 (includes waste oil sump as tank No. 8)
10-5-87	Test Boring Report (Hydrosolutions)
8-2-88	Permit 4654B pulled for 500 gallon concrete drain oil sump
1-12-89	Discovery of 3000 gallon steel tank
3-16-89	Permit 5418B for 3000 gallon steel tank only (pulled by Rudy's)
*3-31-89	Tank cleaned, inspected and removed soil samples S1 and S2 collected
4-13/14-89	Excavation of contaminated soil 9 samples tested by mobile lab
5-31-89	Material divided into 5 piles
*6-1-89	Each pile sampled
*6-15/16-89	All material screened
6-19-89	Fines (-1 inch) hauled to Casmalia
6-19/23-89	Excavation backfilled
6-26-89	Letter to Nichols
7-14-89	Report from Terra-Tech
8-1-89	Discovered permit 5418B covered only 3000 gallon tank

*Tony Palagyi of your Arcadia office was present

The physical arrangements of the waste-oil collection system is shown in the attached sketch.

We request that a single permit be issued to cover both the sump and tank.

Sincerely,

Bill Richardson
Principal Project Engineer

1026-12

INTRODUCTION

The United Concrete Pipe Corporation located at 14041 East Live Oak Avenue in the City of Irwindale, California had used a waste oil system consisting of a 500 gallon concrete sump piped to a 3,000 gallon steel storage tank. In order to comply with the Los Angeles County Public Works Department, Waste Management Division's underground storage tank regulations, United Concrete Pipe Corporation requested the permanent closure of this tank, including removal of the sump and all associated piping. Closure permit #5418B was issued March 16, 1989 (Appendix A). The tank and sump were removed from the ground on March 23, 1989 by Rudy's Service Station Repair and Maint., Inc. of South El Monte, California. The tank was triple rinsed and this rinsate material manifested and taken to Petroleum Recylcing Center in Signal Hill, California (Appendix B). The tank was then rendered inert and certified clean by Harbor Testing Laboratory (Appendix C). The tank was removed from the site the same day by American Metal Recycling in Ontario, California (Appendix D). Soil sampling and laboratory analyses to determine the past integrity of the tank and future use of the soil was peformed by TERRA TECH LABS, Inc. on March 31, April 13 and April 14, 1989. All excavated soil was stockpiled adjacent to the tank pit pending laboratory analyses.

PROCEDURE

Two soil samples were collected from this site on March 31, 1989. One sample each (S2 and S1) was collected from two beneath the north and south ends.

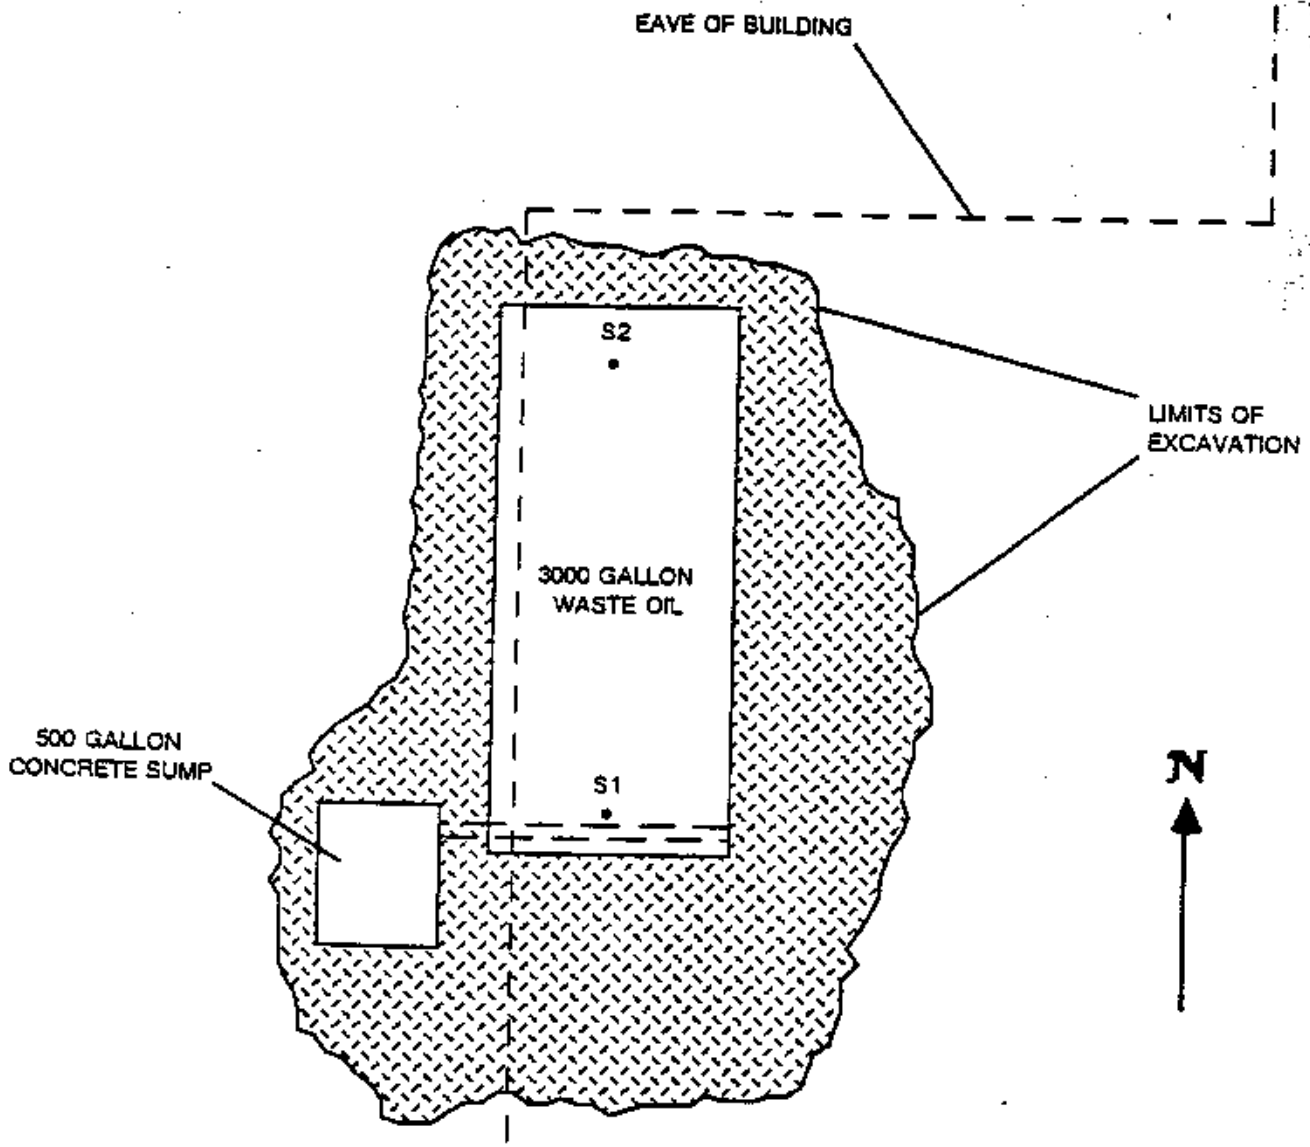
respectively, of the tank (ten feet below ground surface). See Figure 1 for sample locations. These samples were collected under the direction and supervision of Mr. Tony Palagyi, Inspector for the Los Angeles County Department of Public Works Waste Management Division.

On April 13, 1989 two additional samples (S3 and S4) were collected from four and six feet beneath the south end of the 3,000 gallon waste oil tank excavation, respectively (fourteen and sixteen feet below ground surface). One sample (SP1) was also collected from the surrounding spoils pile. See Figure 2.

On April 14, 1989 an additional six samples were collected from the tank excavation. Two samples (S5 and S6) were collected from the north and south ends of the tank excavation at a depth of approximately seventeen feet below ground surface. One sample each (NW, SW, EW and WW) was collected from the north, south, east and west walls, respectively. These wall samples were collected at a depth of sixteen feet below ground surface. See Figure 2 for sample locations. This sampling was overseen by Mr. Tony Palagyi of the Los Angeles County Department of Public Works.

The contaminated soil removed from the excavation was segregated into five spoils piles and the United Concrete Pipe Company requested that TERRA TECH LABS, Inc. return to the site to sample these spoils piles. On June 1, 1989 five samples (SP1-SP5) were collected from the site, one from each spoils pile. See Figure 3 for spoils pile locations and sample locations.

The soil samples were collected with a clean trowel that was washed with trisodium phosphate (TSP), rinsed in distilled water and air dried before each sample



TERRA TECH LABS, INC. AN ENVIRONMENTAL TESTING SERVICE 16371 Gothard Street, Suite G Huntington Beach, CA 92647	FIGURE 1 - SITE PLAN United Concrete Pipe 14041 E Live Oak Baldwin Park, CA	PROJECT NUMBER: 1026-12 DATE: 03-31-89

TERRA TECH LABS, INC. AN ENVIRONMENTAL TESTING SERVICE 16371 Gothard Street, Suite G Huntington Beach, CA 92647	FIGURE 3 - SITE PLAN United Concrete Pipe 14041 E Live Oak Baldwin Park, CA	PROJECT NUMBER: 1026-12 DATE: 06-01-89

was collected. The samples were packed in sterile 8 oz., open mouth glass jars until full, thus allowing no headspace. The jars were then sealed with screw-top caps containing Teflon liners, labeled, and stored in a cooler with ice to maintain laboratory storage temperatures of approximately 4 degrees Centigrade until mobile analyses could be performed. Chain-of-Custody records were completed for each sample to ensure traceability (Appendix E). These samples were collected from the center of the bucket of a backhoe and gradall after soil had been removed down to the aforementioned depths.

Visual inspection of the tank revealed no evidence of leakage or spillage. No odors or staining were evident in the tank excavation. Ground water was not observed in the tank excavation. According to the Los Angeles County Flood Control District's well # 3020G as of October 1988, the depth to ground water adjacent to this site was 159.2 feet below ground surface.

The soil samples were submitted to TERRA TECH LABS, Inc. of Huntington Beach, California on March 31, April 13, April 14, and June 1, 1989. The analysis specified and performed for the samples collected was in accordance with EPA Method 418.1. This method utilizes a solvent (Freon-113) extraction and then analysis with an infrared spectrophotometer (IR). The two original samples collected from the tank excavation (S1 and S2) were also analyzed in accordance with EPA Method 8020 for volatile aromatics.

LABORATORY RESULTS

Chemical analysis of the soil samples collected on March 31, 1989 revealed

sample S1 to have a detectable total recoverable petroleum hydrocarbon concentration of 4780 mg/kg and sample S2 to have a detectable total recoverable petroleum hydrocarbon concentration of 33.1 mg/kg. Sample S2 revealed no detectable volatile aromatic concentrations and sample S1 revealed no detectable benzene, ethylbenzene or total xylene concentrations. Sample S1 revealed a very low detectable level of toluene (0.58 mg/kg). According to the Los Angeles County Department of Public Works, the generally accepted action limit for petroleum hydrocarbons is 100 mg/kg. Therefore, further excavating, sampling and analyses were performed on April 13 and 14, 1989.

Chemical analysis of the two samples (S3 and S4) collected from the south floor of the tank excavation on April 13, 1989 revealed total recoverable petroleum hydrocarbon concentrations of 259 and 202 mg/kg, respectively. The spoils pile sample collected on this date revealed a total recoverable petroleum hydrocarbon concentration of 318 mg/kg. Since these soil samples exceeded the action limit, additional samples were required. Chemical analysis of the six samples (S5, S6, NW, SW, EW and WW) collected on April 14, 1989 revealed total recoverable petroleum hydrocarbon concentrations of ND, 77.7 mg/kg, ND, 30.4 mg/kg, ND and 93.8 mg/kg, respectively (where ND means not detected at 1.0 mg/kg). These samples were not analyzed by EPA Method 8020 for volatile aromatics because the most contaminated sample (S1) did not reveal any significant volatile aromatic concentrations. Because all of these deeper floor and wall samples revealed total recoverable petroleum hydrocarbon concentrations less than the generally accepted action level of 100 mg/kg,

no further sampling or analyses were performed from the tank excavation. See Appendix F for all laboratory results.

The contaminated soil that was removed from the excavation was stockpiled adjacent to the tank excavation while disposal and treatment options are explored. Chemical analysis of the five soil samples collected from the surrounding spoils piles revealed total recoverable petroleum hydrocarbon concentrations of 545, 1500, 1150, 644 and 649 mg/kg (samples SP1-SP5, respectively). See Appendix F. United Concrete Pipe Corporation decided to haul their contaminated soil to a Class 1 Hazardous Waste Facility, but only after a waste minimization process. This waste minimization process was performed in order to remove the rocks and boulders from the soil because of the much lower surface area to weight ratio (representing contaminated soil) of the larger particles (the rocks and boulders). This process was verbally approved by Ms. Nichole Long of the Los Angeles County Department of Public Works (Appendix G). All material from the excavation was passed over a one inch opening screen powered by pneumatic vibrators. Undersize (less than one inch) material was hauled to the Class 1 landfill, while oversize (greater than one inch) material was used as part of the backfill. Approximately one hundred fifty two tons of contaminated soil was removed from this site and sent to Casmalia Resources in Casmalia, California (Appendix H).

In the event of any physical or atmospheric changes adversely affecting the STANDARD SAFETY DESIGNATIONS assigned to any of the above spaces, or if in any doubt, immediately stop all work and contact the undersigned Marine Chemist.

QUALIFICATIONS: Transfer of ballast or manipulation of valves or closure equipment leading to other conditions in pipe lines, tanks or compartments subject to gas accumulation, unless specifically approved in this Certificate, requires inspection and endorsement or reissue of Certificate for the spaces so affected. All lines, vents, heating coils, valves, and similarly enclosed appurtenances shall be considered "not safe" unless otherwise specifically designated.

STANDARD SAFETY DESIGNATIONS (partial list, paraphrased from NFPA 306-1980, Subsections 1-6.1 through 1-6.4, and Subsection 5-3.2).

SAFE FOR WORKERS: Means that in the compartment or space so designated: (a) the oxygen content of the atmosphere is at least 19.5 percent by volume; and that, (b) toxic materials in the atmosphere are within permissible concentrations; and that, (c) the residues are not capable of producing toxic materials under existing atmospheric conditions while maintained as directed on the Marine Chemist's Certificate.

NOT SAFE FOR WORKERS: Means that in the compartment or space so designated, the requirements of Safe for Workers has not been met.

SAFE FOR HOT WORK: Means that in the compartment so designated: (a) oxygen content of the atmosphere is at least 19.5 percent by volume, with the exception of inerted spaces or where external hot work is to be performed; and that, (b) the concentration of flammable materials in the atmosphere is below 10 percent of the lower flammable limit; and that, (c) the residues are not capable of producing a higher concentration than permitted by (b) above under existing atmospheric conditions in the presence of fire, and while maintained as directed on the Marine Chemist's Certificate; and further, that, (d) all adjacent spaces containing or having contained flammable or combustible materials have been cleaned sufficiently to prevent the spread of fire, or are satisfactorily inerted, or, in the case of fuel tanks or lube oil tanks or engine room or fire room bilges, have been treated in accordance with the Marine Chemist's requirements.

NOT SAFE FOR HOT WORK: Means that in the compartment so designated, the requirements of Safe for Hot Work have not been met.

CHEMIST'S ENDORSEMENT. This is to certify that I have personally determined that all spaces in the foregoing list are in accordance with NFPA 306-1980 Control of Gas Hazards on Vessels and have found the condition of each to be in accordance with its assigned designation.

"The undersigned acknowledges receipt of this Certificate under Section 2-3 of NFPA 306-1980 and understands conditions and limitations under which it was issued."

This Certificate is issued on conditions existing at the time the inspection herein set forth was completed and is issued subject to compliance with all qualifications and instructions.

UNITED
CONCRETE PIPE
CORPORATION

June 26, 1989

Los Angeles County
Department of Public Works
Waste Management Division
P.O. Box 1460
Alhambra, CA 91802-1460

Attention: Ms. Nichole Long

Dear Ms. Long:

We have acted upon your verbal approval and backfilled the excavation remaining after removal of our 3,000 gallon waste oil tank.

About one-third of the backfill material was boulders and rocks - the oversize from the 1 inch screening process. The 151.68 tons of undersize was hauled to Casmalia Resources on June 19, 1989.

The screening process resulted in an estimated one-third reduction of material that had to go to disposal. Tony Palagyi of your organization's Arcadia office observed our screening operation. I wish your schedule had permitted you to check it out. I expect, however, that another opportunity will soon come up.

In the meantime, we'll be working on the details needed for completion of this project.

Thanks.!

Sincerely,

Bill Richardson
Principal Project Engineer

APPENDIX D

SITE INVESTIGATION PROCEDURES AND RESULTS

from: Woodward-Clyde Consultants (1989)

APPENDIX D

SITE INVESTIGATION PROCEDURES AND RESULTS

D.1 INTRODUCTION

Several areas of environmental concern were identified by Woodward-Clyde Consultants (Woodward-Clyde) during the preliminary site assessment (PSA) (see Table 2 in report text). The objectives of field investigation conducted by Woodward-Clyde between 12 December 1988 and 28 January 1989 included the sampling and testing of soil, water, and sediment from these areas to evaluate the nature and extent of chemicals present, if any.

Most of the suspect areas identified during the PSA included areas of obvious surface staining (Areas A, B, C, D, E, F, G, H, K, L, M, N, PB, P3, P4, and Q). Soil samples were generally collected at the surface and at various depths below the surface. Other surface areas, unstained but noted during the site visit for other reasons, included I, J, R, and S. Area R did not require sampling because contamination was apparently not present; at Area A, the existence of petroleum hydrocarbons had already been documented. Locations I and I2 were of interest because of suspected solvent use in the general area. Locations J1, J2, and J3 were adjacent to transformers which, from previous testing, were known to contain detectable concentrations of PCBs. Area S contained a transformer which may have PCB concentrations in its oil.

D.2 SOIL SAMPLING

Soil samples were generally obtained from trenches using a backhoe with a maximum reach of 17 feet. The backhoe was

operated by Aman Brothers Construction Company. Small trenches, roughly 4 by 8 feet, were opened to obtain the majority of the samples. Larger trenches (approximately 25 feet long by 4 feet wide by up to 17 feet deep) were opened for more extensive sampling. Trenched areas are indicated on Figure 4 in the report text. Several concrete covered areas required coring before the backhoe could be used for trenching; these locations are also indicated on Figure 4. After trenching to the maximum achievable depth, some areas still showed elevated levels (>1,000 ppm) of volatile hydrocarbons using an OVA. Some of these areas were then evaluated using a drill rig, at locations indicated on Figure 4. Upon completion, trenches were backfilled with the excavated material. Boreholes were grouted bottom to top. A small amount of soil cuttings from the boreholes was stockpiled on site. After collecting samples at the surface, trenching, coring, and/or drilling continued until: (a) the hydrocarbons were no longer evident (by visual observation or OVA readings), (b) the maximum attainable depth was achieved, or (c) trenching or coring was prevented by refusal (unyielding strata).

D.3 TRENCHING

Soil samples were collected at Locations C1, D, E, H1, J1, J2, and J3 on 28 December 1988. Areas C, D, and E included surface soils that were stained and appeared to contain form oil. Location H1 was located in the natural drainage sump close to but downgradient from drums stored nearby on a concrete pad. Locations J1, J2, and J3 were located close to but downgradient of the nearby transformers. Sampling at Area D was limited to the surface because the concrete underlying this area appeared to be in excess of 12 inches thick. There was no evidence that oils or other fluids had

penetrated the underlying concrete. The thin layer of organic material found in the shallow soil atop the concrete appeared to be hydraulic fluid and/or form oil and appeared to be limited to a horizontal area approximately 10 feet by 20 feet. The total volume for the stained material was estimated to be about 4 cubic yards; it remained in place at the site.

Soil samples from Locations B, C3, C4, G1, KC2, L, M, PB, and Q1 were collected on 29 December 1988. Area B includes an area close to a sump containing vehicular waste oil. Access for the trenching was made by saw cutting the overlying concrete. Dark colored soils were noted adjacent to the sump to a depth of approximately 5 feet. (The excavation was temporarily halted for the day pending information about a newly uncovered pipeline of uncertain origin.) As previously mentioned, Area C includes surficial soil apparently contaminated by form oil, and it also includes a natural drainage channel that carries surface runoff from the northern portion of the site. Location KC2 is similar to the other Area C locations, but was apparently recently contaminated with form oil at the surface. Location G1, in the steam cleaning area behind the vehicle maintenance shop, was underlain by concrete approximately 8 inches thick.

Location L was beneath a leaking drum apparently used to dispense a heavy petroleum product. The contamination in this area appeared local and shallow. Location M was apparently a drainage area for the ring plant sinks. The area appeared very wet during the field program, but showed no visual evidence of contamination. Location PB was the stockpiling area for sediment removed from various ponds and sumps at the facility, including the sediments removed from ponds at Locations O1, O2, and P2. The overall pile consisted

of three distinct colorations of soil, each of which was sampled; a composite sample was then made by mixing the separate samples.

Location Q1 was an area overlain by paraffin-laden runoff water from the pipe coating process at the centrifugal line. A soil sample was obtained after coring through approximately 18 inches of concrete. Samples collected from beneath the concrete were noted to have a slight odor similar to the wet, organic-rich smell associated with natural anaerobic decomposition processes, such as those occurring in swamps. The presence of large cobbles precluded sampling below a depth of approximately 18 inches.

On 29 December 1988, Locations B, C5, F, G2, H2, I, I2, N, P3, P4, and Q2 were sampled or resampled. Excavation at Location B was extended, exposing a tank at an approximately 5-foot depth which was approximately 5 feet in diameter by 12 feet in length. Location C5 was planned to be beyond the area of obvious surface soil contamination near the pour line. Evidence of contamination was found down to about a 12-foot depth, where excavation was halted due to organic odors emanating from the hole.

Location G2, in the apparent natural drainage sump downstream from Location G1, was resampled to obtain a more representative sample. Upon coring, a sample was collected at a depth of approximately 12 inches which had a slight odor similar to that noted at Location Q1.

Location H2 was next to unmarked drums. The soil beneath the general area appeared to be fortified with cement or lime that prevented excavation below about 8 feet.

As previously discussed, Locations I1 and I2 are under or adjacent to a solvent storage area. Location I1 was in the drainage downstream from I2 and may also have received contributions of form oil from the pour line. Location I2 was adjacent to and under the actual general solvent storage yard. The area is overlain with asphalt, which showed no visual evidence of contamination.

At Area N, the initial problem involved substantiating the cleanliness of soil from the previous tank excavation. Redigging in the old excavation produced no evidence of contamination, either in the fill or in the bottom of hole, at an approximately 8-foot depth. A nearby tank used for dispensing form oil was noted to have stained a large area next to the centrifugal building. Sampling was not possible directly beneath the tank due to high density of utility lines. Preliminary digging, however, showed the tank to be underlain by asphalt which, in turn, was underlain by a concrete slab of unknown thickness and extent. Samples labeled N were located in the drainage sump downstream from the tank.

Location P3 includes the centrifugal line's designated sump; the sump was surrounded by soil stained with paraffin and perhaps form oil, which probably resulted from sump overflows. During sampling, the sumps were observed to be in an overflow condition. During excavation, the soil was observed to be discolored to a depth of approximately 18 inches. Location P4, adjacent to the paraffin utilization area, showed no visual evidence of contamination at the surface or to excavation depth. Location Q2 was cored approximately 2 feet from the designated drain for the area which ultimately drained to the sumps at Location P3. At

Location Q2, the concrete was approximately 8 inches thick. Sediment from coring had a slight odor similar to that noted at Location Q1.

On 12 January 1989, Location B, in the waste oil sump area, was re-excavated, and Location Q3, in the centrifugal line area, was cored. At Location B, samples were collected at about 1 foot up from the bottom of the tank at both ends. The samples did not appear to be discolored. Samples from Location Q3 appeared to be clean, with none of the odor noted at Locations Q1 and Q2.

On 13 January 1989, Trenches C8 through C12 were opened. Location C8 was selected to better assess the lateral extent of contamination noted earlier at Location C1. Locations C11 and C12 were both relatively shallow because concrete or lime enriched soil prevented excavation to depth. Locations C7, C9, and C10 were longer trenches located at tangents to the pour line track; these trenches were designed to allow a partial three-dimensional view of the contamination near the pour line. Samples collected from these trenches are designated by two numbers, the first of which indicates depth and the second its distance north of the tracks. All three trenches started approximately 10 feet north of the tracks and were extended to the north roughly 25 feet at a depth of approximately 15 feet. Soils in all three were significantly discolored to depths of approximately 5 feet. Soils from the two trenches to the west, C7 and C9, showed significant discoloration to depths of 17 and 12 feet, respectively. In light of high concentrations at depth, a drilling program was planned to better assess the vertical extent of contamination in these areas.

D.4 DRILLING

Drilling was performed by Becker Drills, Inc., of Commerce City, Colorado. Drilling began on 27 January 1989 and was completed on 28 January 1989. Soil borings were drilled using a mobile AP1000 Becker hammer drill with a double wall drive pipe (9-inch O.D. by 6-inch I.D.) driven by a diesel operated pile hammer. The borings were advanced along the pour line to evaluate the vertical extent of the form oil in the soil. Drilling was necessary because the backhoe's reach was limited to 17 feet.

This drilling technique uses air to bring the soil to the surface. In this process, double-wall pipe is driven by a diesel-operated pile hammer, while pressurized air is forced down the annulus at the drive pipe. The compressed air rapidly transports the material cut by the drill bit to the surface through the inside pipe (see attached schematic). The drill cuttings are then passed through a cyclone and discharged onto the ground, where they accumulate. Grab samples were obtained from the accumulated cuttings and placed into 4-ounce Q pak (TM) bottles for laboratory analysis.

Borings were drilled to between about 35 and 54 feet in depth. The specific depth at each boring is shown on the boring logs. The soil was sampled, first at about a 3- to 5-foot depth, then at approximately 5- to 10-foot intervals to boring depth.

Observations made by Woodward-Clyde personnel during the drilling and sampling operations were recorded on the boring logs. These observations include a visual soil description and sampling depth.

D.5 WATER AND SEDIMENT SAMPLES

Areas sampled for water and sediment included the ponds or sumps at P1, P2, and O2. Areas sampled for water only included P3, O1, and Cesspools 1 through 4 (CES1-CES4). Water samples were collected approximately 4 inches below the surface of the water.

Water and/or sediment samples were collected from the settling ponds P1, P2, O1, and O2 on 28 December 1988 (see Figure 4 in report text). Location P1-P2, on the west side of the facility, is an unlined drainage area which, at the north end, receives water from the cement coating manufacturing processes and, at the south end, receives surface runoff from a large portion of the 74-acre site. Sump overflows from pipe manufacturing areas along the centrifugal line may also flow to the south end of these ponds. Sediment samples were taken at an approximate depth of 6 inches. On 1 January 1989, Location P1 was resampled at a depth of 18 inches. This latter sample was called "PB-Sed2" but should not be confused with other samples labeled PB, which were removed from the pond bottom stockpile near the northern end of the site. An oil-like, iridescent sheen was seen on the water surface after sampling the southern end of the pond at both the 6-inch and 18-inch depths. No oil-like sheen was observed during sampling of P2 at the northern end of the pond.

Ponds O1 and O2 are settling ponds located directly outside the concrete cutting process area on the west side of the centrifugal line. During sampling, Pond O1 was approximately 17 feet deep and Pond O2 was approximately 12 feet deep. Sediment in these ponds is periodically removed and added to the pond bottom stockpile located near the northern end of the

site. Pond O1 did not yield a sediment sample because the pond had been recently cleaned. The sediment sample from Pond O2 was chalky and similar in appearance to the samples taken at P2.

Location P3, on the east side of the centrifugal line, consisted of overflow sumps. Solid paraffin-like residues were observed on the surface of soils surrounding these sumps. A sediment sample was not obtainable.

Approximately 10 cesspools are known to be located on the site. The periodic pumping out of these pools is apparently the primary means of sewage disposal on the site. Six cesspools were identified as possibly containing hazardous materials (perhaps from such activities as washing of hands coated with potentially hazardous materials and/or the possible past disposal practices). Of the six cesspools identified, two (CES5 and CES6) were not sampled. CES5, which has not been in regular use for several years, could not be located. CES6 was thought to be similar to CES1, located at the other end of the same building (main shop building).

D.6 DISCUSSION OF ANALYTICAL RESULTS

Analytical results are presented in Table 3 (soil samples) and Table 4 (water samples) of the report text. Elevated concentrations (>100 ppm) of heavy hydrocarbons (C_9-C_{30}) were found at a depth of approximately 5 feet at Area B, the location of the waste oil sump. The hydrocarbons were not found deeper at elevated concentrations. The liquid in the underground tank in Area B showed elevated hydrocarbon concentrations (1,000,000 ppm TPH, by EPA Method 418.1; 7 ppm total lead; and 83,600 ppm diesel hydrocarbons, by EPA Method 8015). The concentrations of hydrocarbons in material

sampled from the tank are consistent with the known use of the tank, which was to collect waste oil from the vehicle maintenance shop. The liquid in the tank was removed during the removal of the tank (see Appendix C).

Areas sampled along the pour line are shown on Figure 4. Results obtained from samples taken from Trenches C5, C7, and C10 show significant concentrations of TPH to depths of about 15 to 17 feet. Other trenches show declining concentrations with increasing depth, as in Trench C9. Samples taken from borings at the pour line show consistent decreases in concentration with depth. Soil samples taken below approximately 20 feet show low levels of TPH.

Two soil samples from the pour line area were evaluated to assess if they were hazardous under current regulations. The samples were analyzed for flash point (EPA Method 1010), pH (EPA Method 9045), purgeable organics (EPA Method 8240), and base/neutral and acids (EPA Method 8270) and aquatic toxicity. It was determined that the material has no detectable flash point. The pH of the material is between 8.74 and 9.13. Organics quantified in the samples were toluene (47 ppb), ethylbenzene (29 ppb), and 1,1,1-trichloroethane (27 ppb). Acetone at 60 ppb was detected in one sample, most likely attributable to laboratory contamination. Laboratory data sheets are included in Appendix E. No compounds were present above the detection limit when the samples were analyzed by EPA Method 8270. An aquatic toxicity evaluation was performed on the samples, and the results indicate that the material is non-hazardous with respect to aquatic toxicity. A final determination on management of this material will require discussions with the appropriate regulatory agencies.

Four cesspool areas were sampled to ascertain whether these areas are strictly domestic flow or if products from the manufacturing process were also discharged. The samples were analyzed for aromatic volatile aromatics using EPA Method 602. Two areas (CES-3B, CES-4B) showed no detectable concentrations of volatile organics or halogenated organics. CES-1B contained 112 ppb of volatile hydrocarbons (BTXE).

Soils from Areas G, L, and M were analyzed for evidence of solvent use. No significant concentrations were found, and it was concluded that no contamination from the use of solvents has occurred in this area.

Soil samples from Area Q (surface staining by hydraulic fluid) showed no significant hydrocarbon concentrations. Sediments and/or water sampled for volatiles and halogenated organics at Areas O and P, near the centrifugal building, showed no significant concentrations of either.

A sediment sample collected from the pond on the western side of the property on 12 January 1989 showed elevated concentrations of TPH (4,430 ppm), with kerosene (2,540 ppm) the dominant fraction at the 18-inch depth.

More comprehensive sampling conducted on 6 June 1990 included the collection of ten additional samples to better characterize the distribution of TPH in the sediments. Samples were collected at depths of 6, 24, 36, and/or 42 inches at five locations, and were tested for TPH. All the samples contained less than 500 ppm TPH (diesel), and the concentrations decreased with depth at four of the five locations. TPH concentrations at the 24- to 42-inch depth ranged from non detect (ND) to 142 ppm. Use of the pond as

a settling basin for water made turbid from concrete processing associated with pipe production may have yielded a semi-impervious barrier at the pond bottom.

LABORATORY REPORT

Samples Received: Fifty-three (53) soils and eleven (11) liquids
Date Received: 12-28-88
Date Released for Analysis: 12-29-88
Purchase Order No: Proj#: 8840472A/United Concrete

The samples were analyzed as follows:

Samples Analyzed	Analysis	Results
Three (3) liquids, fifteen (15) soils	Volatile Organics by EPA 624/8240	Data Sheets
Nine (9) soils	Fuel Hydrocarbons by modified EPA 8015 (LUFT Manual, May 1988)	Table I
One (1) soil	PCB's by EPA 8080	Table II
Eight (8) soils	CAM (17) Metals by ICPMS	Quant Reports
One (1) soil	Total Petroleum Hydrocarbons by EPA 418.1	Table III

Data Reporting Qualifiers

Value - If the result is a value greater than or equal to the Detection Limit (DL), the value is reported.

ND - Indicates that the compound was analyzed for but not detected. The minimum DL for the sample with the ND is reported based on necessary concentration or dilution actions.

TR - Indicates an estimated value. This flag is used when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified DL but greater than zero.

BATCH: B222
ANALYSES: TPH, 418.1, 7420, 8020, 8010

PROJECT: #8840484A-2000, 14041 E. Live Oak Ave., Irwindale

Enclosed with this letter is the report on the analyses performed on samples B011289-1/14.

The samples were received by CRL intact and with the chain of custody record attached.

Please note that ND means not detected and DL means detection limit.

Stated below are the pertinent quality control data.

Matrix: Soil

Date	Method	Analyte	%R[1] Matrix spike	Matrix spike dup.		RPD[2]	
01/12	TPH	Diesel	73.	104.	pass	39.	pass
01/12	418.1	Oil/grease	128.	126.	pass	2.	pass
01/22	7420	Total Lead	91.	89.	pass	2.	pass
01/12	8020	Benzene	89.	100.	pass	12.	pass
		Toluene	100.	100.	pass	0.	pass
		Ethyl Benzene	100.	106.	pass	6.	pass
		Total Xylenes	100.	100.	pass	0.	pass

[1] %R - per cent recovery
[2] RPD - relative per cent difference between MS and MSD recoveries.

BATCH: 493
ANALYSES: 418.1

PROJECT: United Concrete, 14041 E. Live Oak Ave., Irwindale

Enclosed with this letter is the report on the analyses performed on samples 012889-1/14.

The samples were received by CRL intact and with the chain-of-custody record attached.

Please note that ND means not detected and DL means detection limit.

Stated below are the pertinent quality control data.

Matrix: Soil

Date	Method	Analyte	%R[1] Matrix spike	Matrix spike dup.		RPD[2]	
01/28	418.1	Oil/grease	101.	103.	pass	2.	pass

[1] %R - per cent recovery
[2] RPD - relative per cent difference between MS and MSD recoveries.

ANALYSIS NO.: G-8901605-001
ANALYSES: EPA Method 8270
DATE SAMPLED: 01/12/89
DATE SAMPLE REC'D: 01/16/89
PROJECT: Woodward-Clyde, Irwindale

Enclosed with this letter is the report on the chemical and physical analyses on the sample from ANALYSIS NO: G-8901605-001 shown above.

The sample was received by CRL in a chilled state, intact, and with the chain-of-custody record attached.

Solid samples are reported on an "as received" basis.

Please note that ND( ) means not detected at the detection limit expressed within the parentheses.

Verbals were given on January 27, 1989 at 9:20 A.M. to Mr. Bill Jeong.

ATTN: Mr. Allistair Callendar

ANALYSIS NO.: G-8902610-001/002
ANALYSES: Miscellaneous
DATE SAMPLED: 12-JAN-1989/13-JAN-1989
DATE SAMPLE REC'D: 26-JAN-1989
PROJECT: #8840484A 2000
14041 E. Live Oak Avenue
Irwindale, CA

Enclosed with this letter is the partial report on the chemical and physical analyses on the samples from ANALYSIS NO: G-8902610-001/002 shown above.

The samples were received by CRL in a chilled state, intact, and with the chain-of-custody record attached.

Solid samples are reported on an "as received" basis.

Please note that ND( ) means not detected at the detection limit expressed within the parentheses.

Verbals for all results excluding EPA Method 8270 and Bioassay were given on January 31, 1989 at 4:00 P.M. to Mr. Callendar. Results for EPA Method 8270 were given on February 1, 1989 to Dot Nelson.

Please note Bioassay results will follow.

Myung J. Kim

WOODWARD-CLYDE CONSULTANTS
5055 Antioch Road
Overland Park, KS 66203
ATTN: MR. ALISTER CALLENDER

Analysis No.: G-8902610-002
Date Sampled: 12-JAN-1989
Date Sample Rec'd: 26-JAN-1989
Date Analyzed: 1-FEB-1989
Date Extracted: 26-JAN-1989
Sample Type: SOLID

Project: #8840484A 2000 (14041 E. LIVE OAK AVE.,IRWINDALE)
Sample ID: CSB-16

Base/Neutrals & Acids EPA 8270

Units: mg/kg

Analysis	Result	Blank	Detection Limit
Dibenzofuran	ND	ND	3.3
2,4-Dinitrotoluene	ND	ND	3.3
2,6-Dinitrotoluene	ND	ND	3.3
Diethylphthalate	ND	ND	3.3
4-Chlorophenyl-phenylether	ND	ND	3.3
Fluorene	ND	ND	3.3
4-Nitroaniline	ND	ND	16.7
4,6-Dinitro-2-methylphenol	ND	ND	16.7
N-Nitrosodiphenylamine	ND	ND	3.3
4-Bromophenyl-phenylether	ND	ND	3.3
Hexachlorobenzene	ND	ND	3.3
Pentachlorophenol	ND	ND	16.7
Phenanthrene	ND	ND	3.3
Anthracene	ND	ND	3.3
Di-n-butylphthalate	ND	ND	3.3
Fluoranthene	ND	ND	3.3
Pyrene	ND	ND	3.3
Butylbenzylphthalate	ND	ND	3.3
3,3'-Dichlorobenzidine	ND	ND	6.7
Benzo(a)anthracene	ND	ND	3.3
bis(2-Ethylhexyl)phthalate	ND	ND	3.3
Chrysene	ND	ND	3.3
di-n-Octylphthalate	ND	ND	3.3
Benzo(b)fluoranthene	ND	ND	3.3
Benzo(k)fluoranthene	ND	ND	3.3
Benzo(a)pyrene	ND	ND	3.3
Indeno(1,2,3-cd)pyrene	ND	ND	3.3
Dibenz(a,h)anthracene	ND	ND	3.3
Benzo(g,h,i)perylene	ND	ND	3.3

LABORATORY REPORT

Samples Received: Nineteen (19) soil samples
Date Received: 12-27-88
Purchase Order No: Proj#: 8840472A/United Concrete

The samples were analyzed as follows:

Samples Analyzed	Analysis	Results
Five (5) soils	Volatile Organics by EPA 8240	Data Sheets
Two (2) soils	PCB's by EPA 8080	Table I
Two (2) soils	Fuel Hydrocarbons by modified EPA 8015 (LUFT Manual, May 1988)	Table II
Three (3) soils	Total Petroleum Hydrocarbons by EPA 418.1	Table III

Data Reporting Qualifiers

Value - If the result is a value greater than or equal to the Detection Limit (DL), the value is reported.

ND - Indicates that the compound was analyzed for but not detected. The minimum DL for the sample with the ND is reported based on necessary concentration or dilution actions.

TR - Indicates an estimated value. This flag is used when the mass spectral data indicates the presence of a compound that meets the identification criteria but the result is less than the specified DL but greater than zero.

TANK CLOSURE REPORT

prepared for

RUDY'S SERVICE STATION
REPAIR AND MART, INC.
United Consumer Club Corporation
16871 Beach Blvd. Suite 204
Huntington Beach, California

prepared by

TERRA TECH LABS, Inc.
Huntington Beach, California

April 1990

INTRODUCTION

The United Concrete Pipe Corporation located at 14041 East Live Oak Avenue in the City of Irwindale, California had used a waste oil system consisting of a 500 gallon concrete sump piped to a 3,000 gallon steel storage tank. In order to comply with the Los Angeles County Public Works Department, Waste Management Division's underground storage tank regulations, United Concrete Pipe Corporation requested the permanent closure of this tank, including removal of the sump and all associated piping. Closure permit #5418B was issued March 16, 1989 (Appendix A). The tank and sump were removed from the ground on March 23, 1989 by Rudy's Service Station Repair and Maint., Inc. of South El Monte, California. The tank was triple rinsed and this rinsate material manifested and taken to Petroleum Recylcing Center in Signal Hill, California (Appendix B). The tank was then rendered inert and certified clean by Harbor Testing Laboratory (Appendix C). The tank was removed from the site the same day by American Metal Recycling in Ontario, California (Appendix D). Soil sampling and laboratory analyses to determine the past integrity of the tank and future use of the soil was peformed by TERRA TECH LABS, Inc. on March 31, April 13 and April 14, 1989. All excavated soil was stockpiled adjacent to the tank pit pending laboratory analyses.

PROCEDURE

Two soil samples were collected from this site on March 31, 1989. One sample each (S2 and S1) was collected from two beneath the north and south ends.

respectively, of the tank (ten feet below ground surface). See Figure 1 for sample locations. These samples were collected under the direction and supervision of Mr. Tony Palagyi, Inspector for the Los Angeles County Department of Public Works Waste Management Division.

On April 13, 1989 two additional samples (S3 and S4) were collected from four and six feet beneath the south end of the 3,000 gallon waste oil tank excavation, respectively (fourteen and sixteen feet below ground surface). One sample (SP1) was also collected from the surrounding spoils pile. See Figure 2.

On April 14, 1989 an additional six samples were collected from the tank excavation. Two samples (S5 and S6) were collected from the north and south ends of the tank excavation at a depth of approximately seventeen feet below ground surface. One sample each (NW, SW, EW and WW) was collected from the north, south, east and west walls, respectively. These wall samples were collected at a depth of sixteen feet below ground surface. See Figure 2 for sample locations. This sampling was overseen by Mr. Tony Palagyi of the Los Angeles County Department of Public Works.

The contaminated soil removed from the excavation was segregated into five spoils piles and the United Concrete Pipe Company requested that TERRA TECH LABS, Inc. return to the site to sample these spoils piles. On June 1, 1989 five samples (SP1-SP5) were collected from the site, one from each spoils pile. See Figure 3 for spoils pile locations and sample locations.

The soil samples were collected with a clean trowel that was washed with trisodium phosphate (TSP), rinsed in distilled water and air dried before each sample

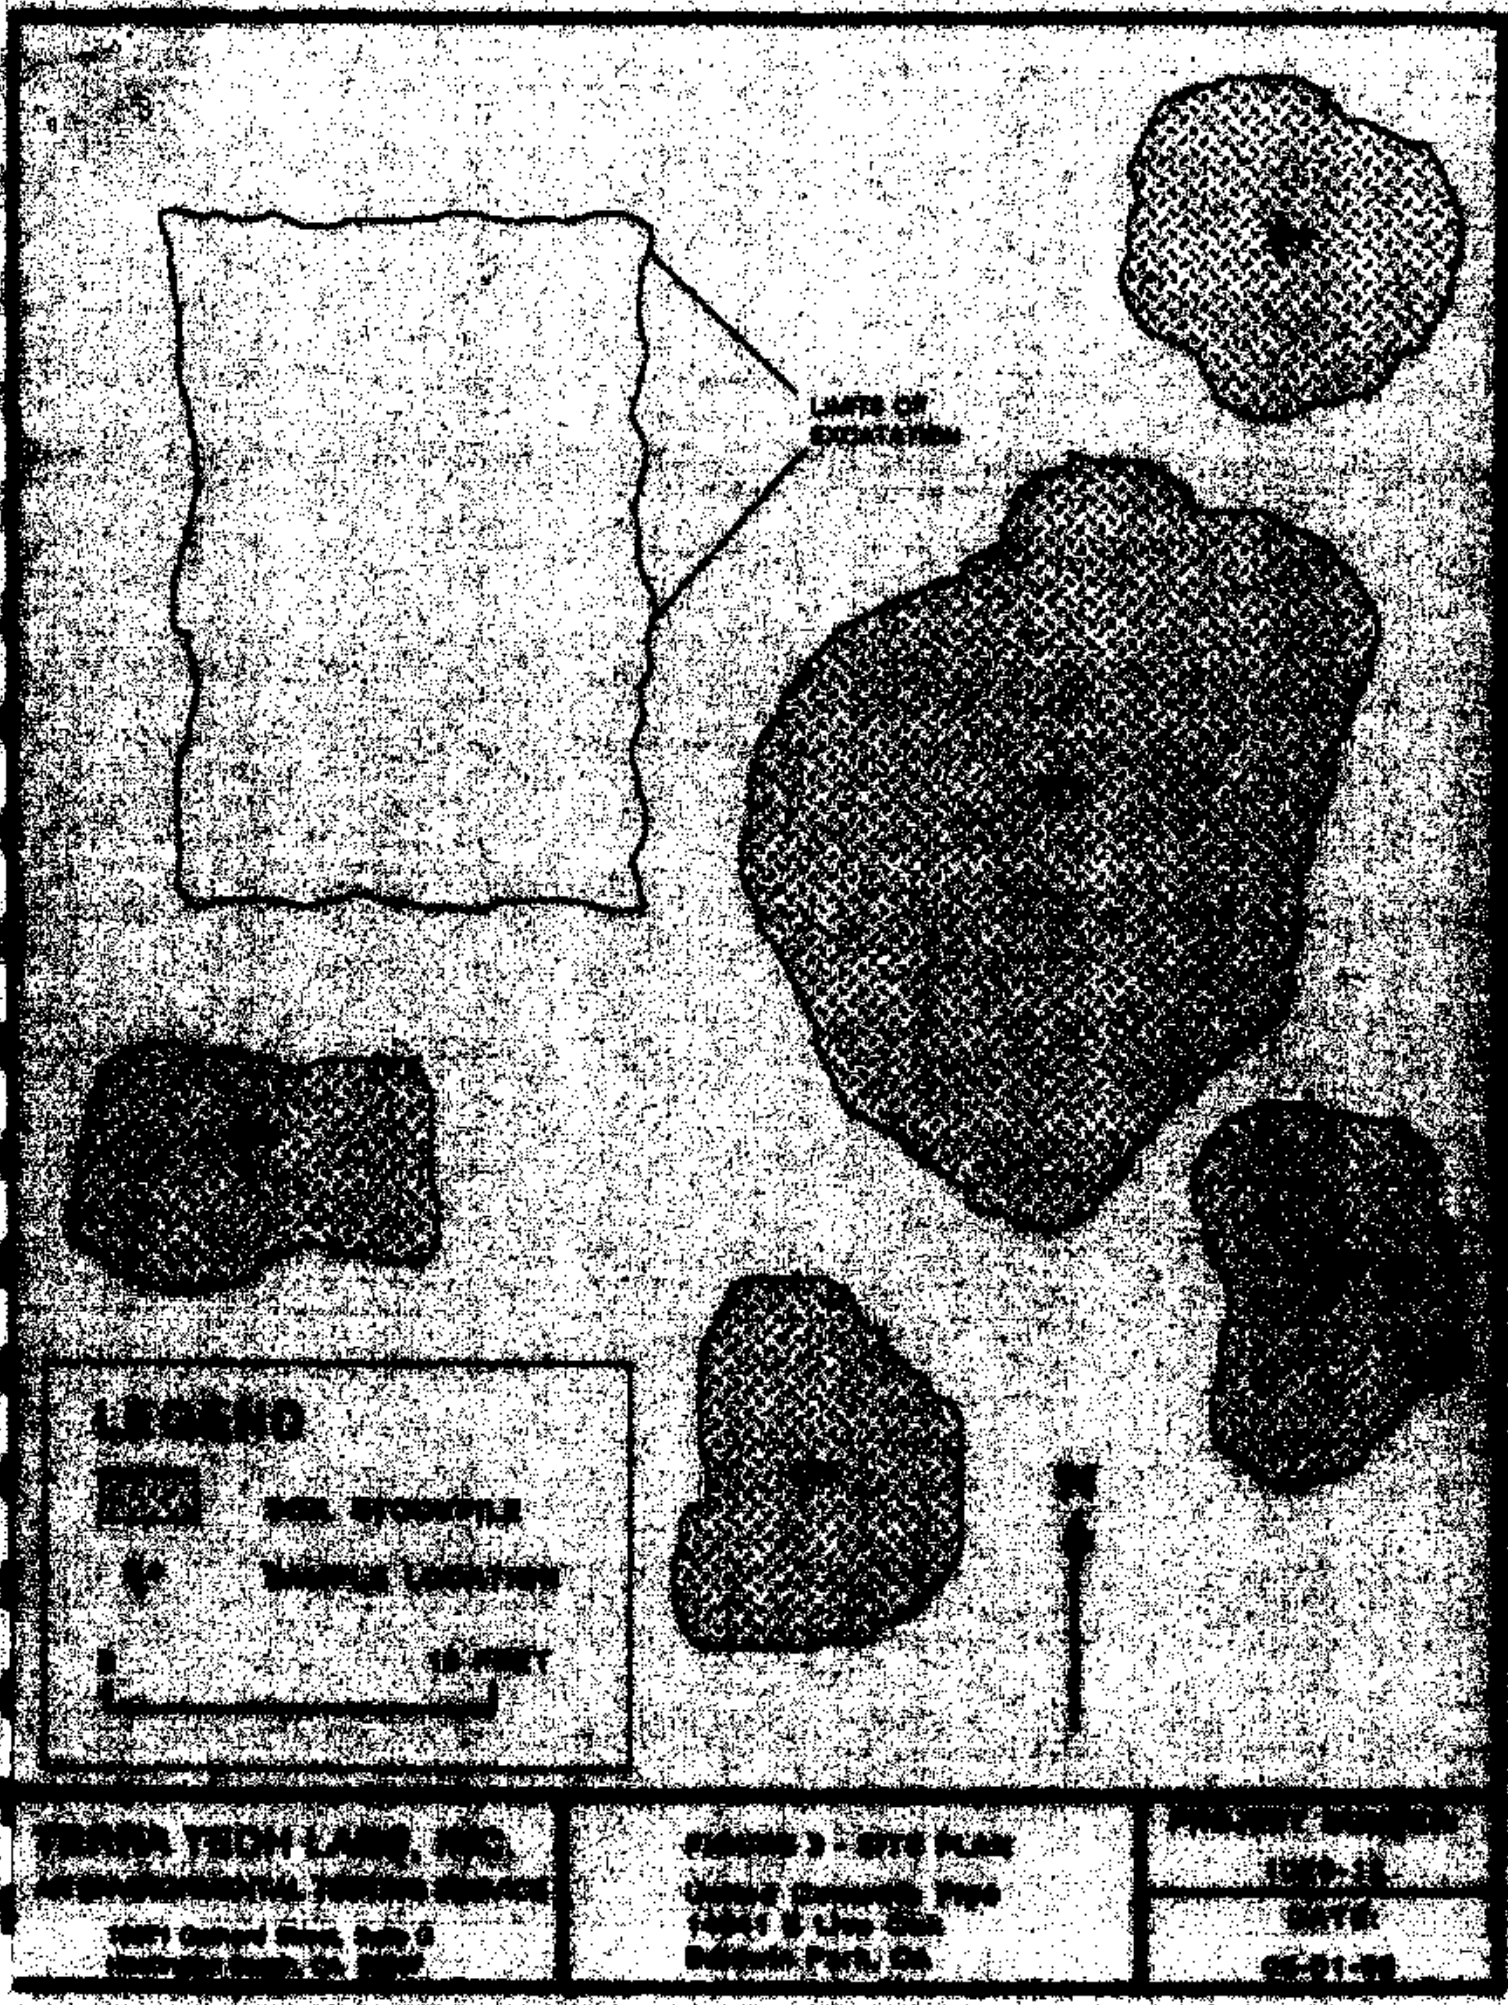
TERRA TECH LABS, INC. AN ENVIRONMENTAL TESTING SERVICE 1871 Oakrise Street, Suite 4 Rancho Cordova, CA 95670	FIGURE 2 - SITE PLAN United Gasoline, Inc. 14041 E. Live Oak Baldwin Park, CA	PROJECT NUMBER: 1995-11 DATE: April, 1995



LIMITS OF
EXCAVATION

was collected. The samples were packed in sterile 8 oz., open mouth glass jars until full, thus allowing no headspace. The jars were then sealed with screw-top caps containing Teflon liners, labeled, and stored in a cooler with ice to maintain laboratory storage temperatures of approximately 4 degrees Centigrade until mobile analyses could be performed. Chain-of-Custody records were completed for each sample to ensure traceability (Appendix E). These samples were collected from the center of the bucket of a backhoe and gradall after soil had been removed down to the aforementioned depths.

Visual inspection of the tank revealed no evidence of leakage or spillage. No odors or staining were evident in the tank excavation. Ground water was not observed in the tank excavation. According to the Los Angeles County Flood Control District's well # 3020G as of October 1988, the depth to ground water adjacent to this site was 159.2 feet below ground surface.

The soil samples were submitted to TERRA TECH LABS, Inc. of Huntington Beach, California on March 31, April 13, April 14, and June 1, 1989. The analysis specified and performed for the samples collected was in accordance with EPA Method 418.1. This method utilizes a solvent (Freon-113) extraction and then analysis with an infrared spectrophotometer (IR). The two original samples collected from the tank excavation (S1 and S2) were also analyzed in accordance with EPA Method 8020 for volatile aromatics.

LABORATORY RESULTS

Chemical analysis of the soil samples collected on March 31, 1989 revealed

sample S1 to have a detectable total recoverable petroleum hydrocarbon concentration of 4780 mg/kg and sample S2 to have a detectable total recoverable petroleum hydrocarbon concentration of 33.1 mg/kg. Sample S2 revealed no detectable volatile aromatic concentrations and sample S1 revealed no detectable benzene, ethylbenzene or total xylene concentrations. Sample S1 revealed a very low detectable level of toluene (0.58 mg/kg). According to the Los Angeles County Department of Public Works, the generally accepted action limit for petroleum hydrocarbons is 100 mg/kg. Therefore, further excavating, sampling and analyses were performed on April 13 and 14, 1989.

Chemical analysis of the two samples (S3 and S4) collected from the south floor of the tank excavation on April 13, 1989 revealed total recoverable petroleum hydrocarbon concentrations of 259 and 202 mg/kg, respectively. The spoils pile sample collected on this date revealed a total recoverable petroleum hydrocarbon concentration of 318 mg/kg. Since these soil samples exceeded the action limit, additional samples were required. Chemical analysis of the six samples (S5, S6, NW, SW, EW and WW) collected on April 14, 1989 revealed total recoverable petroleum hydrocarbon concentrations of ND, 77.7 mg/kg, ND, 30.4 mg/kg, ND and 93.8 mg/kg, respectively (where ND means not detected at 1.0 mg/kg). These samples were not analyzed by EPA Method 8020 for volatile aromatics because the most contaminated sample (S1) did not reveal any significant volatile aromatic concentrations. Because all of these deeper floor and wall samples revealed total recoverable petroleum hydrocarbon concentrations less than the generally accepted action level of 100 mg/kg,

no further sampling or analyses were performed from the tank excavation. See Appendix F for all laboratory results.

The contaminated soil that was removed from the excavation was stockpiled adjacent to the tank excavation while disposal and treatment options are explored. Chemical analysis of the five soil samples collected from the surrounding spoils piles revealed total recoverable petroleum hydrocarbon concentrations of 545, 1500, 1150, 644 and 649 mg/kg (samples SP1-SP5, respectively). See Appendix F. United Concrete Pipe Corporation decided to haul their contaminated soil to a Class 1 Hazardous Waste Facility, but only after a waste minimization process. This waste minimization process was performed in order to remove the rocks and boulders from the soil because of the much lower surface area to weight ratio (representing contaminated soil) of the larger particles (the rocks and boulders). This process was verbally approved by Ms. Nichole Long of the Los Angeles County Department of Public Works (Appendix G). All material from the excavation was passed over a one inch opening screen powered by pneumatic vibrators. Undersize (less than one inch) material was hauled to the Class 1 landfill, while oversize (greater than one inch) material was used as part of the backfill. Approximately one hundred fifty two tons of contaminated soil was removed from this site and sent to Casmalia Resources in Casmalia, California (Appendix H).

The preceding sampling procedures were reviewed and found acceptable by a California Registered Geologist whose validation appears below:

OF NO OXYGEN.
SAFE FOR HOT WORK TO
CUT TANK IN TO SCRAP.
THE TANK CONTAINS THREE
UNDERGROUND LINES. NO HOT WORK
NEAR LINES FEEDING LINES
FROM TANK.
NO GAS IN AIR. THE
ENTIRE TANK INERTED
WITH WATER.

In the event of any physical or atmospheric changes adversely affecting the STANDARD SAFETY DESIGNATIONS assigned to any of the above spaces, or if in any doubt, immediately stop all work and contact the undersigned Marine Chemist

QUALIFICATIONS: Transfer of ballast or manipulation of valves or closure equipment tending to alter conditions in pipe lines, tanks or compartments subject to gas accumulation, unless specifically approved in this Certificate, requires inspection and endorsement or release of Certificate for the spaces so affected. All lines, vents, heating coils, valves, and similarly enclosed appurtenances shall be considered "not safe" unless otherwise specifically designated.

STANDARD SAFETY DESIGNATIONS (partial list, paraphrased from NFPA 306-1980, Subsections 1-8.1 through 1-8.4, and Subsection 5-3.2).

SAFE FOR WORKERS: Means that in the compartment or space so designated: (a) the oxygen content of the atmosphere is at least 19.5 percent by volume; and that, (b) toxic materials in the atmosphere are within permissible concentrations; and that, (c) the residues are not capable of producing toxic materials under existing atmospheric conditions while maintained as directed on the Marine Chemist's Certificate.

NOT SAFE FOR WORKERS: Means that in the compartment or space so designated, the requirements of Safe for Workers has not been met.

SAFE FOR HOT WORK: Means that in the compartment so designated: (a) oxygen content of the atmosphere is at least 19.5 percent by volume, with the exception of inerted spaces or where external hot work is to be performed; and that, (b) the concentration of flammable materials in the atmosphere is below 10 percent of the lower flammable limit; and that, (c) the residues are not capable of producing a higher concentration than permitted by (b) above under existing atmospheric conditions in the presence of fire, and while maintained as directed on the Marine Chemist's Certificate; and further, that, (d) all adjacent spaces containing or having contained flammable or combustible materials have been cleaned sufficiently to prevent the spread of fire, or are satisfactorily inerted, or, in the case of fuel tanks or lube oil tanks or engine room or fire room bilges, have been treated in accordance with the Marine Chemist's requirements.

NOT SAFE FOR HOT WORK: Means that in the compartment so designated, the requirements of Safe for Hot Work have not been met.

CHEMIST'S ENDORSEMENT. This is to certify that I have personally determined that all spaces in the foregoing list are in accordance with NFPA 306-1980 Control of Gas Hazards on Vessels and have found the condition of each to be in accordance with its assigned designation.

"The undersigned acknowledges receipt of this Certificate under Section 2-3 of NFPA 306-1980 and understands conditions and limitations under which it was issued."

This Certificate is based on conditions existing at the time the inspection herein set forth was completed and is issued subject to compliance with all qualifications and instructions.

Attention: Ms. Nichole Long

Dear Ms. Long:

We have acted upon your verbal approval and backfilled the excavation remaining after removal of our 3,000 gallon waste oil tank.

About one-third of the backfill material was boulders and rocks - the oversize from the 1 inch screening process. The 151.68 tons of undersize was hauled to Casmalia Resources on June 19, 1989.

The screening process resulted in an estimated one-third reduction of material that had to go to disposal. Tony Palagyi of your organization's Arcadia office observed our screening operation. I wish your schedule had permitted you to check it out. I expect, however, that another opportunity will soon come up.

In the meantime, we'll be working on the details needed for completion of this project.

Thanks.!

Sincerely,

Bill Richardson
Principal Project Engineer

APPENDIX E
QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

LEO REBELE

Principal

Mr. Rebele is a Principal in the Irvine office of Ramboll, with responsibilities that include business development, client liaison, senior oversight and execution on projects involving environmental site investigation, litigation, remediation, environmental permitting and natural resource management. Experience includes the following:

- Supported private industry for more than 25 years by delivering solutions to problems involving real estate due diligence, waterfront and brownfield redevelopment, transit-oriented development, and ports/harbors and watershed-related services. Project experience has been split between managing uplands projects focusing on property transfer/redevelopment and assisting private and port clients with aquatic-related environmental issues.
- Provided high-level strategic redevelopment consulting services to municipalities and private developers in connection with the transfer and redevelopment of contaminated real estate. Clients include residential, commercial and industrial developers, land owners, attorneys, and real estate brokers. Implementing cost recovery actions by providing environmental litigation support services; designing and implementing environmental liability transfer programs including guaranteed fixed-price remediation (GFPR) contracts.
- Provided environmental litigation support services in matters involving cost recovery actions against responsible parties. Deposition and trial experience including a landmark litigation case 3000 E. Imperial v. Robertshaw Controls et al. Routinely conducts environmental forensics analyses with a specialty in compound-specific isotope analysis (CSIA). Develops and applies multi-media video and animation for purposes of trial exhibits and mediation settlement discussions.
- Managed and supervised dozens of Phase I and II environmental site assessments (ESAs) and remediation projects throughout the western United States, Canada, and Mexico; assessed sites affected by landfill materials, chlorinated solvents, heavy metals, petroleum hydrocarbons (including free product), polychlorinated biphenyls (PCBs), and strong acids; prepared site conceptual models; performed remedial investigation/feasibility studies (RI/FSs); managed the completion of human health risk assessments; and evaluated remedial action alternatives under the Comprehensive

Environmental Response, Compensation, and Liability Act (CERCLA) and ensuring compliance with the National Contingency Plan (NCP). Regulatory negotiation/site closure experience with various jurisdictional offices of the Regional Water Quality Control Board (CRWQCB) and the California Department of Toxic Substances Control (DTSC), Orange County (California) Health Care Agency, the City and County Fire Departments of Los Angeles and the San Diego County of Environmental Health.

- Managed and provided oversight for projects involving natural resource management issues, including wetland evaluations and permitting, marine benthological studies, sediment and water quality monitoring, and underwater and eelgrass surveys. Experience has also included developing public outreach materials on behalf of private-sector clients, conducting resource mapping using Global Positioning System (GPS) software and geographic information system (GIS) technology.
- Served as program manager for several environmental impact assessments under National Environmental Policy Act (NEPA) and California Environmental Quality Act. Projects include environmental assessments (EAs) for proposed telecommunication sites on federal land, municipal well installations, private urban infill developments and mega-scale solar facilities located in Los Angeles County and San Bernardino County.

EDUCATION

1997
MS, Marine Resource Management (Minor, Aquatic Toxicology)
Oregon State University

1994
BS, Biological Oceanography (Honors)
University of British Columbia

PROJECTS

2016-2017
Environmental Oversight
Mr. Rebele served as the principal-in-charge for the environmental oversight of a sewer line replacement in an area where groundwater impacted by chlorinated volatile organic compounds (cVOCs) associated with a State Superfund site may be encountered by city workers. The scope of work involves navigating concerns of a contentious community group and ensuring the protection of City workers through the development and implementation of a field monitoring program during sewer line construction activities.

2017
Due Diligence and Environmental Compliance Review
Mr. Rebele lead a due diligence and environmental compliance team in support of an acquisition of a 700-acre terminal in the Port of Los Angeles. The work involved a comprehensive assessment of current practices involving the use, storage and disposal of hazardous materials, compliance with air and stormwater regulations, and a review of historical spills and cleanup activities. A Phase I Environmental Site Assessment was conducted as part of the review. A review of California Environmental Quality Act (CEQA) permitting issues was also performed to evaluate the potential for terminal expansion onto an unoccupied portion of the facility.

2017-present

Pilot Testing and Support of Guaranteed Fixed Price Remediation Program

Mr. Rebele is heading a comprehensive site investigation and pilot test to evaluate a proposed groundwater and soil remediation strategy in support of a guaranteed fixed-price remediation (GFPR) strategy. The property, which is being sold to an industrial developer, is impacted by moderated levels of trichloroethylene and perchloroethylene in groundwater, with impacts extending off-site. Concentrations of chlorinated VOCs in soil vapor beneath the manufacturing facility were found to be very high, requiring immediate mitigation. Mr. Rebele is leading the project team to develop a groundwater remedy under a possible GFPR contract option while designing soil vapor extraction and vapor mitigation system that can be implemented in the short term.

2016-present

Implementation of Mitigation Monitoring, New Residential Development

Mr. Rebele served as principal-in-charge for a project involving implementing mitigation monitoring requirements for biological and cultural resources under California Environmental Quality Act (CEQA). Work included conducting ongoing monitoring for cultural and biological resources during disturbance of native soils during grading for a new residential development. Challenges included working with changing client schedules and interfacing with regulatory personnel to keep the project on-track on-schedule.

2016-present

Redevelopment of former ITT Site into new Industrial Complex

Lead consultant for a high-profile industrial redevelopment project in Santa Ana, California. The project involves assisting the prospective developer with the pre-bid due diligence during the seller's auction, evaluating seller's proposed remedial strategy in the context of the proposed development, performing Phase I and II environmental assessments, regulatory agency negotiation, and the design of a vapor mitigation system. Complexities in the due diligence activities include the integration of a polychlorinated biphenyl (PCB) cap into the proposed development and integrating the proposed electrical resistance heating/steam injection remedial program with client's development plans.

2016-2017

Implementation of Soil Management Plan and Soil Stockpile Profiling for Residential Development Project

Mr. Rebele served as client services manager for a project involving the redevelopment of a former foundry and iron works facility. The soils beneath the property were identified though a combined Phase I/II Environmental Site Assessment to be impacted with Cal-Hazardous levels of lead. A combination of field screening using a portable X-Ray Fluorescence (XRF) meter and confirmation soil sampling with formal laboratory analysis in order to profile soils to be exported and to establish residual concentrations in soils. Cost effective management of soils was achieved through carefully interfacing with the client's grading contractor and project phasing.

2015-present

Innovative In-Situ Remediation of Chlorinated Solvents

Account manager for Griffon Corporation to remediate a chlorinated VOC plume in groundwater which is commingled with chlorinated solvent plumes on adjacent properties. The remediation is confounded by access restrictions associated with a storm channel and two sewer lines. In addition two distinct groundwater mounds resulting from leaks in the sewer lines are affecting the groundwater flow and distribution of the contamination. Mr. Rebele is overseeing the forensic evaluation of sources of VOCs, general strategy, remedial approach and is leading regulatory negotiations.

2015-2017

In-situ Capping of Heavy Metal Impacted Soils

For this former tool manufacturing facility (Union Fork and Hoe Company) in upstate New York, Mr. Rebele served as project principal and client service manager. The site, which has been under the

oversight of the New York State Department of Environmental Conservation (NYSDEC) and Department of Environmental Health. Mr. Rebele helped Griffon negotiate a capping remedy of the heavy metals impacted soil. A significant component of the work has been negotiating with NYSDEC and DOH to eliminate a mature wooded area from the remediation area and to reduce the long-term groundwater monitoring obligations.

2005->>>

Ongoing Brownfield Advisory and Consulting Services

Serves in a strategic consulting role on behalf of the City for the remediation and brownfield planning of a 170-acre downtown core area targeted for redevelopment. Work to date has included federal and state brownfield grant procurement and execution, brownfield inventory, development of a GIS system, development of an area-wide brownfield remediation strategy, Phase I and II Environmental Site Assessments, development of multiple remedial action plans under the oversight of the Department of Toxic Substances Control, litigation support for cleanup cost recovery, and waste to energy (WTE) consulting.

2007->>>

Alameda Triangle Redevelopment

Provided oversight and consulting services for an 11.2 acre project comprised of 5 parcels with multiple ownerships and a history of manufacture use dating to World War II. The property uses identified including a former Witco chemical facility located on Caltrans property, a Magnetek transformer repair and refurbishment business, two auto-wrecking yards, a former railroad right-of-way, and a variety of other uses involving the manufacture and use of various chemical materials. The chemicals detected on-site during Gannett Fleming and other site investigations included organochlorine pesticides, PCBs, free product petroleum hydrocarbons in groundwater and soil, chlorinated VOCs in soil and soil vapor, heavy metals and polynuclear aromatic hydrocarbons. The City is in the process of marketing the site for development. Following a multi-media investigation involving substantial site access coordination, Gannett Fleming prepared a Site Investigation Report, Feasibility Study and a Remedial Action Plan (RAP) for the entire Site. The reports were submitted to Department of Toxic Substances Control (DTSC) for review. Gannett Fleming is working with city's environmental counsel to develop a cost recovery strategy.

2017

Economic Development Department

Mr. Rebele is working with the City of South Gate Economic Development Department and their economic development consultant, Rosenow Spivasek Group (RSG,) in addressing environmental impacts associated with a historical gasoline service station. Mr. Rebele and his team were retained to take over all aspects of the assessment and cleanup activities from a prior consultant due to a stalled remedial program.

2015-2016

Operational Transition/Environmental Compliance

Project Principal for an operational transition project involving all aspects of environmental compliance as Bombardier took over rail service and maintenance responsibilities for all rail facilities from the prior operators of the North County Transit District (NCTD) facilities at the Escondido and Oceanside yards. Work involved initial consultation, environmental compliance audits, permitting, preparation of spill prevention control and countermeasure (SPCC) plans, stormwater pollution prevention plans (SWPPS) and environmental compliance plans for ongoing rail operations and facility maintenance.

2014->>>

Remediation of Organochlorine Pesticide Impacted Soils in Support of Residential Development

Mr. Rebele serves as the principal-in-charge for a residential development project involving the remediation of organochlorine pesticides (OCPs) and closure of historical underground storage tanks

(USTs), irrigation wells and low-level volatile organic compounds (VOCs). In his role, Mr. Rebele is served in a strategic capacity to result in a fast-track review and approval of a remedial action plan by transferring the open case file from a local oversight agency to the Santa Ana Regional Water Quality Control Board.

2014-present
Remediation of Groundwater at Logistically Constrained Shopping Center
Mr. Rebele has been serving as principal-in-charge for a complex gasoline remediation project involving very high concentrations of gasoline at a commercial shopping center where site access precludes implementation of many traditional remedies. Mr. Rebele serves as senior technical advisor to the client's environmental counsel and is working to reduce the environmental liabilities of the property owner. Mr. Rebele helped devise a two-part strategy aimed at protecting the current tenants against indoor air intrusion through the development of vapor mitigation systems while conducting an aggressive groundwater remedial program consisting of trenching/product removal followed by in-situ chemical oxidation of groundwater.

2014-present
Environmental Remediation Consulting in Support of Residential Development
Mr. Rebele served in a strategic consulting role for New Urban West, Inc. (NUWI) to support the redevelopment of infill properties throughout southern California. Projects have included former nursery/greenhouse areas, manufacturing operations and properties and areas impacted by fill materials. Currently executing several cleanup programs under a California Land Reuse and Revitalization Act (CLRRA) agreement with the Department of Toxic Substances Control.

2014-2017
Redevelopment Consulting and Remediation
Mr. Rebele serves as the project principal for a residential redevelopment project at a former Teledyne research and development facility and historical agricultural operation. Work has involved several phases of soil, soil vapor and groundwater investigation that included multiple degreaser locations, additional potential source areas of metals and petroleum hydrocarbons and organochlorine pesticides associated with the historical agricultural use. A soil vapor extraction (SVE) was implemented to reduce elevated concentrations of PCE to acceptable levels in order to prepare the Site for residential occupancy. The site is currently undergoing redevelopment.

STEPHANIE T ECKELMAN

Senior Consultant 1

KEY COMPETENCIES

Stephanie Eckelman has been an environmental consultant since 2000. Stephanie has conducted numerous ASTM Phase I Environmental Site Assessments of commercial, industrial and residential properties. She has assisted with multiple soil, groundwater, and soil vapor investigations for subsurface investigations and groundwater monitoring programs. Stephanie has conducted multiple waste audits for clients and has helped prepare waste audit documentation forms.

PROJECTS

Phase I Environmental Site Assessment

Black Equities Warner Ctr Phase I, Woodland Hills, California, United States, Black Equities Group Ltd., 2018-2019

Ramboll conducted a Phase I ESA for the northwestern portion of a property (former Northrop Grumman facility "Parcel A") located at 5500 Canoga Ave and 21240 Burbank Blvd, Woodland Hills, CA, referred to by the client, Black Equities Group, as the Warner Center Project.

Site environmental auditor

Conduct the site visit, interview on-site personnel, contact agencies, update staff on site status and prepare closing report.

Manufacturing Facility Potential Relocation, Bakersfield, California, United States, 2008

Water supply availability research and compilation

Research and report preparation

Researched and prepared report detailing various Urban Water Management Plans in the Central Basin for client to make informed decision on future land use purchase.

Multiple Phase I ESA projects, California, United States, 2005-2020

Prepared ASTM Phase I reports, including site visits, agency records reviews, and aerial photograph reviews on numerous properties including manufacturing, commercial retail properties, defense-related facilities;

Consultant

conducted multiple Phase I ESA site audits, client communication, subcontractor communication, report preparation and staff scheduling as needed.

Phase I Environmental Site Assessments, California, United States, 2005-2020

Ramboll conducted Phase I Environmental Site Assessments on multiple private, public and municipal properties.

SPECIAL COMPETENCIES

Due Diligence Phase I ESA
Waste Audits
gINT boring log template creation

TOTAL YEARS OF EXPERIENCE

17

EDUCATION

1998 BS, Environmental Studies

COURSES/CERTIFICATIONS

2020 OSHA 40-hour Hazardous Waste Operations and Emergency Response Standard - HAZWOPER

Consultant
Conduct site visits, prepare written reports, interact with clients and agencies, contract with subcontractors and update additional staff if the project required additional Ramboll services.

Site Solutions

Investec: 2019 DryCleaner Comp Rev, Santa Barbara, Camarillo, Chula Vista, California, United States, Investec Real Estate, 2019
Ramboll conducted reviews of three drycleaners located at the Central Plaza Shopping Center, 708 Arneill Road, Camarillo, California; the Mesa Shopping Center, 1998 Cliff Drive at Meigs Road, Santa Barbara, California; and the Plaza at Sunbow, 601 East Palomar Street Chula Vista, California.
Site personnel
Conduct site inspection, conduct personnel interviews, prepare report and share findings with client.

Underground Storage Tank Removal Oversight, Alhambra, California, United States, 2018-2019
Multiple abandoned UST's located and removed from the site.
Field Supervisor
Tasks included scheduling subcontractors, overseeing UST removals, collection of confirmation sampling, agency oversight communication, and report preparation.

KS: Home Depot - LBP - California, California, United States, The Home Depot, 2017-2019
Ramboll Environ assisted in connection with an investigation involving Home Depot’s renovation projects in homes that may have contained lead based paint.
Site auditor
Conducted lead based paint sampling oversight, coordinate subcontractors and residents, prepare written documentation.

Former Oil Field Pre- and Post- Stormwater Site Inspection, Santa Clarita, California, United States, 2007-2008
Conducted Storm Water Pollution Prevention Plan monitoring including pre- and post-storm surface inspection on a form large oil field
Inspector
Conduct pre- and post-storm water site investigation for damaged BMP's on a large vacant former oil field.

Lage Redevelopment Project, Santa Clarita, California, United States, 2006-2011
Conducted soil sampling, surface water runoff sampling, groundwater sampling, soil vapor sampling and groundwater pump tests at a 1000-acre property;
Site staff
Collect soil samples, storm water samples, groundwater sampling and soil vapor samples.

Pool Product Manufacturer, California, United States, 2002-2009
Prepared and submitted Wastewater Treatment Surcharge Statements and tracked Wastewater Treatment Surcharge Quartely Reports for a facility in South Los Angeles;
Site staff
Prepared wastewater treatment surcharge statements, updated staff and client on changes and maintained submission requirements.

Entertainment Industry, Glendale, California, United States, 2001
Managed well decommissioning, including permitting, for deep wells for various municipalities;
Onsite personnel
Managed well decommissioning, including permitting, for deep well located in Glendale.

Generate various boring log templates.

Baker: SSF Add. Site Investigation, Not specified, California, United States, Baker Properties, Inc., 2017-2018
Ramboll Environ conducted a soil, soil vapor, groundwater, and indoor air investigation at 160-180 Sylvester Road, South San Francisco, CA.
Boring log
Prepare MIP boring logs for the site.

Boring Log template generation, California, United States, Multiple client projects., 2015-2020
Prepared multiple subsurface boring log templates for multi-office use with gINT boring log software.
Boring Log Generator
Created and implemented new boring log templates and reports for numerous large scale projects.

Large Shipping Company: 2019 California Waste Audit, California, United States, Amazon.com Services Inc., 2019-2020
Ramboll performed an evaluation of the contents of municipal solid waste containers at three locations in California.
Waste Auditor
Conducted waste audit of compacted 40 cubic yard bin with agency oversight.

Telecommunication: CA CJ Audits, Not specified, California, United States, 2015-2020
Ramboll Environ conducted hazardous waste audits and trash sorts at multiple California locations of a telecommunications company in order to fulfill the requirements of a Consent Judgment against the company.
Auditor
Conducted multiple waste audits through multiple years at facilities throughout Southern and Central California.

NE Corner Victoria St/Central, Carson RAP, Corner of South Central Avenue and Victoria Street, Carson, CA, United States, The Carson Project Owner, LLC, 2017-2018
Ramboll prepared a Human Health Risk Assessment, conducted a statistical evaluation on distribution of chemicals, prepared a Remedial Action Plan and provided project management, attended meetings, and provided estimated costs for site remediation

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Comments
No additional comments.

Receipt
The samples were received on 1/10/2022 6:00 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.4º C.

Receipt Exceptions
The container label for the following sample did not match the information listed on the Chain-of-Custody (COC): SB-4-7-220110 (440-294012-7). The container label list SB-7-10, while the COC lists SB-7-4.

Sample ID was logged in per COC.

GC/MS VOA
Method 8260B: The initial calibration curve analyzed in batch 570-207111 was outside method criteria for the following analyte(s): Bromomethane. As indicated in the reference method, sample analysis may proceed; however, any detection or non-detection for the affected analyte(s) is considered an estimated concentration.

Method 8260B: The matrix spike duplicate (MSD) recoveries and precision for analytical batch 570-207111 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) precision was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
Method 8015B: The method blank for preparation batch 570-207034 and analytical batch 570-207016 contained C23-C40 above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries of Antimony for preparation batch 440-664214 and analytical batch 440-664719 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits

GC Semi VOA

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
Sample custody seals, if present, are intact.	N/A	Not Present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	IDs on containers do not match the COC. Logged in per COC.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Comments
No additional comments.

Receipt
The samples were received on 1/11/2022 4:20 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.7º C.

GC/MS VOA
Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-206969. A laboratory LCS/LCSD was analyzed to provide precision data.

Method 8260B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-207186. A laboratory LCS/LCSD was analyzed to provide precision data.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC VOA
Method 8015B: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with analytical batch 570-207463. A laboratory LCS/LCSD was analyzed to provide precision data.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals
Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries of Antimony for preparation batch 440-664214 and analytical batch 440-664719 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Accreditation/Certification Summary

Client: Ramboll US Corporation
Project/Site: Rexford- Irwindale

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
Sample custody seals, if present, are intact.	N/A	Not Present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A
